

Panasonic ideas for life

LEAVE MOTION BLUR BEHIND WITH 600Hz NeoPDP

The power of High Definition can move you like nothing else. But at high speeds, objects can become blurred and your experience less vivid.

600Hz NeoPDP delivers unrivalled clarity, even at full speed. And it's this technology that features in nine of the new Viera televisions, all of which have Freesat HD built-in.

Because motion clarity matters,

EVERYTHING MATTERS.

Plasma TV technology has drawn the short straw of late, with some high profile supporters withdrawing from the market and the LCD hordes rolling out LED backlit sets to considerable effect. But Panasonic

believes it can reinvigorate the technology with its new NeoPDP panel. And having spent some time with the new Z1 (P48), I think it's right. This is a remarkable new plasma screen, beautiful to look at and with a surprisingly low power consumption. I'd argue that plasma has long given the most cinematic of flatscreen images, and this screen ups the ante.

I didn't think it would be too long before we saw the UK's first supermarket Blu-ray player, but Aldi's teutonic Tevion DVD1100 has a cute trick. Not only is it cheap, but with a simple hack it can be made to switch regions! Turn to P78 for more!

Enjoy the show!

Unleash the emotion

Denon DBP-2010 BD Player www.denon.co.uk

Portner with... Optoma ThemeScene HD86 Full HD projector £5,000 approx

To get the most of your Blu-ray's picture performance you'll want the biggest image possible. So why not invest in a high-quality projector, like Optoma's latest 1080p DLP model? It features 700:1 ANSI contrast ratio, 1,600 ANSI lumens brightness, PureMotion2 picture technology and two HDMIs.

Denon may have been a little late out of the Blu-ray starting blocks, but it's playing catch-up fast. The latest BD spinner to be announced is the mid-range DBP-2010 (pictured here atop the forthcoming AVR-1910 receiver). Despite a more competitive £600 price tag than its previous decks, Denon hasn't skimped on the high-performance tech, with Anchor Bay video processing, Profile 2.0 functionality and 7.1 channel analogue audio outputs....

Monitor Audio unleashes Vector

Just below the Radius HD in the company's speaker line-up, Monitor Audio's new Vector

range comprises the V10 wall-mounting satellite (£150 per pair), the V20 centre-channel (£100) and the VW-8 compact 100W active subwoofer (£200). The V10 and V20 both use a 4inch bass driver with MMPII cones and a lin gold C-CAM dome tweeter. As an optional bass upgrade for larger rooms, the V10 and V20s can be matched with the existing 250W Radius HD370 subwoofer (£500).

Onkyo raises the AVR bar

Onkyo claims that its two new THX Select2 Plus-certified 7.2-channel receivers are 'the best specified

AV receivers that have ever been available at their price points'. Hyperbole perhaps, but its past record is impressive. At around £700 and £800 respectively the 7x 160W TX-SR707 and 7x 180W TX-NR807 offer Audyssey DSX and Dolby Pro-Logic IIz decoding, Faroudja DCDi Cinema video processing and ultra-low jitter Burr-Brown 192kHz/24-bit DACs. The NR807 also offers DLNA networking.

Picture perfect

JVC's professional division bowed its first LED-backlit LCD monitor at the recent UK CEDIA Expo with

the promise of a consumer TV to follow. The super-thin £2,000 Xiview LT-42WX70 uses edge-LED illumination while its PhotoPro function is fine-tuned to display digital stills at their highest quality. There's also 52 tweaks to fine-tune images, including individual colour management of skin tones, making this one of the most versatile Full HD displays on the market, and one to audition for those with a hankering for tinkering.

Team HCC reveals its Playback picks of the last month

1 The Take

Brutal, bold and brilliantly played, this is the best British gangster series since *The Paradise Club*. A bare bones release but well worth checking out. Steve May

2 Persepolis (Region B Blu-ray)

uncannily poignant with its focus on the 1970s' Iranian Revolution. Rik Henderson

3 Hotel for Dogs

I'm a real sucker for pooches in flicks, and this is a hotbed of movie mutt action. There goes my street cred. *Mark Craven*

4 A Bug's Life (All region Blu-ray)

Not my favourite Pixar film by any measure, but the 1080p picture quality on this All-region US Blu-ray is mind-blowing. Anton van Beek

5 House: Season Five

The doctor is in and grouchier and more sarky than ever before as *House* finds a new home on Sky One. *John Rook*

World's first LED DLP PJ

Innovative model challenges 3-chip DLP rivals for half the cost

Vivitek has launched the first DLP projector to use a trio of LED modules instead of a lamp for a light source. As a result, the H9080FD can deliver ultra-high contrast images with widegamut colour, Instant On (no warm-up period), a long-lifespan, quoted at 20,000 hours and no colour fringing (aka the DLP 'rainbow effect'), because there's no need for a colour wheel.

James Hue, from Vivitek, told HCC: 'The PhlatLight LED module we use is fast and accurate, and offers much better colour than that from LCD.' De-interlacing and general image processing comes via a Gennum processor. Connectivity and control includes two HDMI 1.3 inputs, component, composite and S-video, VGA and RS-232. Hue says an anamorphic lens and sled will become available in due course.

However, you'll need a sizeable theatre to accommodate it. Tipping the scales at 16kg, and with the dimensions of a small ottoman, the H9080FD is a bit of a beast. 'The size and weight is largely down to the heatsinks which are used to cool the projector,' explains Hue. 'There are six fans but they move very slowly to gently expel hot air. That's why the projector is so quiet. We quote an operational noise of just 26dB.'

'The size of the PI is down to the heatsinks and fans,' says Vivitek's James Hue 'but it keeps things quiet.'

HCC previewed the revolutionary projector, running through Quantum of Solace and

Transformers on Blu-ray, and came away from our session impressed. In use, we found the image to be very contrasty (despite a low quoted light output of 800 lumens), with punchy, accurate reds. Texas Instruments' Dynamic Iris technology promises a contrast ratio of 100,000:1.

According to Vivitek's, two more conventional single-chip DLP models will join the brand's line-up this autumn. Both aimed at AV fans, one will be priced at a highly competitive £1,000, with a step-up high-end model coming in at around £5.000.

In the DLP projector hierarchy, the H9080FD appears to find itself up against three-chip 720p and 1080p models both in terms of size and performance. Yet with an expected list price of £10,995, it comes in at half the price.

LED is rapidly becoming a hot topic in the

DLP projector community.

Norwegian specialist

projectiondesign has a competing model and DLP market leaders Sim2 are also in the game. Sim2's James Buckle told HCC: 'Our LED projector is in the final stages of development.'

Hush: Vivitek's beast runs at a mere 26dB >

Demo'd!

The AV highlights of... Punisher: War Zone on Blu-ray

Back in black

07.19: Test your display's calibration when the Punisher whacks mob boss Uncle G. First, for the inky blacks as he cuts the lights, then for deep reds as he illuminates the room with a flare.

A stitch in time

31.12: Jigsaw is no looker following his accident at a glass recycling plant, but this close-up of his mangled face reveals a wealth of fine detailing in the stitching and scars that the AVC 2.40:1 encode handles with ease.

Messy business

59.27: The clarity of the Dolby TrueHD 5.1 audio is heard in this sequence where the Punisher shoots a goon in the head at close range. It sounds like an over-ripe watermelon struck by a sledgehammer and it feels like you're sitting at the heart of every splat and drip.

Shoot 'em up

82.50: As rival criminal gangs take each other out, a tooled-up Punisher turns up to save the day. The resulting six minutes of relentless carnage ensure the lossless audio is positively bristling with positional effects and thumping bass.

BD to lose component out

It's digital-only for HD video signals according to new regulations

HD analogue component outputs on Blu-ray players are to be phased out during 2010, and all analogue outputs will disappear by 2013. That's the main effect of the final draft of the Advanced Access Content System (AACS) specification, recently released by the AACS Licensing Administrator.

AACS is a compulsory part of the Blu-ray specification, which all licensees must implement. It controls the way in which Blu-ray content is encoded, and is a central plank of the agreement between the movie studios and BD player makers.

Until now, there has been an 'analogue hole' in the content protection system, as the interim specification allowed Blu-ray HD to be used with TVs that lack HDMI connections. It's this analogue hole which is now being filled, with the removal of the HD progressive scan options from component video outputs. After it comes into effect on December 31, 2010, we will be left with 480i and 576i via component video, and composite and S-video outputs. By 2013 end, all analogue outputs will vanish.

In an exclusive interview with HCC, the AACS LA's primary spokesman Michael Ayers described the process as 'Not just a suggestion – this is the analogue sunset. The idea is to recognise the 'analogue hole', that HD analogue content is vulnerable to unauthorised copying, and to phase it out as people move naturally to digital. The world is moving that way anyway, as it offers better picture and sound, and other flexibility,

so let's take advantage of the evolution.'

So could there be a surge of buying before analogue-free BD players are launched? 'Once manufacturers sign the AACS licences, there is a grace period before the new requirements come in,' explained Ayers. 'But we don't anticipate any sort of panic buying. There could be some who are interested in retaining earlier functionality, that happens with any number of technology transitions — but we're looking at taking advantage of an evolution that is already occurring, as people look forward to new features such as BD live.'

Ayers went on to say that speculation that the Blu-ray format may have a limited shelf-life was no real concern to the AACS LA. 'We're a technology that supports various formats, primarily BD at the moment, and AACS is glad to support that, but AACS is designed to be extensible, so if there is a next generation hardware format or a downloading method, it's very likely that AACS will support that.'

The other significant feature of the final draft specification is the implementation of the 'managed copy' feature that was missing from the interim spec. This should allow Blu-ray disc users to make digital copies of high definition media for their computers or mobile devices – as long as the movie studios choose to make the option available.

Vanishing trick: The component outs on this Blu-ray player will soon be a thing of the past

Glad tidings

Get ready to cross another title off your 'Most Wanted Blu-rays' list, as Universal Pictures

has confirmed that it will be releasing the long awaited *Gladiator* in the UK on September 7. Universal seems to have pulled out all of the stops with this one, putting together two BD50 discs featuring both the Oscar-winning theatrical and extended cuts of the film. Also included are all of the extras from the old three-disc DVD box set, plus new U-Control material for both the film itself and the feature-length documentary included on the second BD disc!

Jesus vs Vikings

Now this is the kind of high concept film that gets the *HCC* team excited, no matter how puts the

concept sounds. Outlander stars Jim
'The Passion of the Christ' Caveizel as a
space man who crashes on Earth during
the reign of the Vikings, bringing with
him a deadly alien monster. The film
didn't make much of a splash at the
cinema, but is sure to find a more
appreciative audience when
Momentum Pictures brings it to DVD
and Blu-ray in the UK on August 31.
Extra material includes a commentary,
Making of ... featurette, deleted scenes
and more.

Set faces to stunned

Thank heavens for JJ Abrams' re-imagining of Star Trek. While the rest of this year's mega-hyped summer

blockbusters were mostly turkeys, Star Trek was the one film that delivered spectacle, excitement and a storyline that didn't insult the intelligence. And it looks like it's going to make a kick-ass Blu-ray title when it beams into stores in early October. Rumoured specs include 1080p video, Dolby TrueHD 5.1 soundtrack, an audio commentary, 24 featurettes, nine deleted scenes, a gag reel, a BD-Java Starfleet simulator, four trailers and BD-Live content.

Pick'n'mix

Pat Mills, 'the godfather of British comics' and creator of science-fiction title 2000AD, picks his five fave DVDs

1 The Third Man

I watch this on average three times a year and I'm still looking for reasons to watch it more.

2 Michael Collins

An Irish friend said she wanted to meet Michael Collins in Heaven more than her husband. He really had that much charisma.

3 Entourage

This comedy series is a great blokes' fantasy. It's also based on the LA film agency I'm with, but I can assure you it's not true!

4 Shoot 'Em Up

Excellent comic book-style. Most comic books aren't this cool.

5 Reilly Ace of Spies

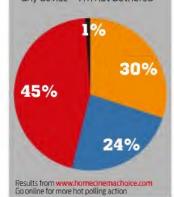

They don't make TV series like this any more. No dumbing down and superb attention to detail.

Visit www.2000adonline.com this August and pick up copies of Pat Mill's latest graphic novels, including A.B.C. Warriors: The Volgan War, Vol.1, Flesh and Defoe 1666

We asked...

Do you have, or plan to make, a dedicated home cinema AV room...

- Yes, I've made a room just for movies and music!
- I'm planning on constructing a viewing room
- No, we still use the front room
- I'll watch movies anywhere, on any device – I'm not bothered

Optoma's new dimension

3D home entertainment technology is expected by December

Optoma has thrown its weight behind 3D display technology with its first compatible projector.

Demonstrated at CEDIA 2009, and sat inside the casing of a HD65, the as-yet unnamed device is due out before the year end. It can project stereoscopic 3D images without needing a separate lens or conjoined unit. Viewers wear dedicated active stereoscopic glasses with shuttered LCD lenses to get the three-dimensional effect, but it's a highly effective method, especially in comparison to rival anaglyphic technologies that use red and blue lenses.

However, the glasses don't come cheap. They synchronise with the projector so you won't need a separate IR receiver and will be compatible with future Optoma projectors, but will cost approximately £50 a pair.

Justin Halls, the company's Senior Product Manager, believes the cost of the high-spec specs is justified. For him, shuttered lenses are vital whatever the price: 'Anaglyphic 3D uses the old blue and red filter glasses, which give very poor colour reproduction and a rather

fuzzy image.
Polarised 3D
systems use
passive glasses that
give very good image
quality and are low cost,
however, two projectors
are generally required,
making this an
expensive and
impractical system for
home use.

'The Optoma 3D Ready system uses one projector and DLP-Link

Good image quality at a low cost epitomises Optoma's approach to 3D projectors according to Justin Halls

active LCD shutter glasses. This gives fantastic image performance and is extremely

easy to use. Also, with this system the projector can be used for normal movie watching as well as 3D.'

It's also a way of keeping the projector cost down. The first model is expected to sell for less than £500. It will be HD Ready only, with a native resolution of 1280 x 720, but that's partly due to the nature of the stereoscopic content that's available. It would be pointless to launch with a Full HD, fully-specified device if there's nothing to run on it yet.

'As soon as a 3D Blu-ray format is agreed, and there have been steps towards this in recent months, I anticipate that major movie titles will be made available in 3D soon afterwards,' explains Halls. Until then the projector's prime use will be for gaming: 'Currently there are hundreds of

PC game titles that will work in Stereoscopic 3D.

But it's the home cinema application of the technology that we await with bated breath. Halls sums it up: 'Who wouldn't want life-size, three-dimensional images of Angelina Jolie in their front room?'

Popcorn goes Blu

When it comes to media servers you can't do much better than the Popcorn Hour A-100

Networked Media Tank. But this looks set to change with the imminent arrival of the company's Popcorn Hour C-200. The package now adds an RF remote control, multi-line LCD display and gigabit Ethernet, but most significantly a slot designed for a Blu-ray drive, allowing you to transform the unit into a complete media solution. However, due to DRM issues, don't expect to rip Blu-rays to a built-in hard-drive. Although UK pricing hasn't been confirmed, we expect the C-200 to retail for around £200.

Cideko unveils 'wireless bridge'

Cideko has launched the two-piece Air Sender package, a wireless video sender/ streamer able to send

hi-def video and audio from source to screen. By adding extra client receivers, the same signal can be routed to multiple screens. It uses real-time encode/decode technology over an 802.11n wi-fi link. Front mounted USB ports allow playback of AV content from sticks and external drives. Video file format support covers WMV, AVI and Mpeg 2/4. While the streamer only transmits up to 720p or 1024 x 768, the receiver upscales all sources to 1080p and outputs them via HDMI.

Cello introduces SD PVR TVs

As well as sporting integrated DVD players, Cello Electronics' new HD Ready LCD TVs have

PVRs that store programming on external SD cards. Instead of using an internal HDD, each TV has a sidemounted SD card slot. Compatible memory cards of various sizes can be used to store recordings that can also be backed-up on a PC or Mac. The TVs also have two tuners, so two shows can be recorded at the same time, although capacity is obviously limited to the size of the card used. The screens come in 22in, 26in and 32in sizes and prices start at around £400 for the smallest model.

This month's top ten news stories in handy, bite-sized chunks...

Finger-slim LED

Over in Korea, Samsung has unveiled a new 23in Full HD LED-backlit monitor that not only requires 40 per cent less power and can produce more vibrant colours, but which the Korean press release claims is 'finger-slim'.

This probably relates more to the slender fingers of the Korean lady pictured above than the chunky digits of your typical tech journo.

Is tosh turning blu? Will Toshiba now back Blu-ray? The smart money says 'Yes', after company chairman Atsutoshi Nishida hinted to shareholders in Tokyo that

'It makes no sense to decide not to enter the Blu-ray market simply because we lost the format war. We cannot change the fact that we lost.'

At the Sharp end
The US is reportedly close to banning imports of LCD TVs made by Sharp.
The move hinges on a patent dispute between Sharp and TV rival Samsung, with the US International Trade Commission ruling in favour of Samsung, declaring that Sharp LCD displays violate at least one of its patents.

Re-classified!
The BBFC has revised its Classification
Guidelines. There are too many to list here
(visit www.bbfc.co.uk for the full list), but
HCC was amused by the one concerning sexual
innuendo in 12A-rated films like Norbit and Epic
Movie. We reckon anything that keeps crap like
that from a larger audience is a good thing.

Freeview HD
Freeview managing director Ilse Howling
has stated that Freeview HD will be
available to half of all UK homes for

the 2010 World Cup, with the number rising to 60 per cent (approximately 16 million households) by the following Christmas. The Freeview chief also confirmed that work was progressing on a next-generation Freeview box, able to offer BBC iPlayer and other VOD services

Movie merger

Three of the world's most famous movie studios may merge elements of their DVD operations. Execs from 20th Century Fox, Paramount and Sony Pictures are reportedly discussing combining DVD production and distribution in an effort to save money.

Save the planet
Sony claims that it has managed to reduce its global CO2 emissions by approximately 100,000 tons over the last financial year. This follows several company-wide environmental initiatives. 'European operations have reduced CO2 emissions by approximately 90 per cent between 2000 and 2008,' added the Japanese company.

Pioneer hearts Sharp S-LCD, Pioneer

and Sharp have finally contracted to create a new joint-venture company to develop Blu-ray and other optical disc products. First mooted back in April, the joint-venture, with the snappy title Pioneer Digital

Design and Manufacturing Corporation, begins operations on October 1.

BD-Live gets IMDB wannabe
We've been waiting years for a good BD-Live application, and it looks like Sony Pictures might have finally come up with the goods. The company recently announced MovielQ, a new real-time movie database full of trivia and cast/crew info that can be accessed while watching some films on Blu-ray. MovielQ will roll

out with the Blu-ray release of Angels & Demons

on September 14.

Turn off, say 'wow'

A recent Sky+HD advertising campaign has left potential customers baffled, as its threestep instructions can draw a blank with viewers. The campaign, the tag-line for which is 'Are you sure you're watching in high definition?' points out that having an HD ready TV doesn't automatically get you high-definition channels or an HD picture. It goes on to give instructions that if followed will leave customers staring at a blank screen.

The ad tells consumers to 1.

Turn off your HD ready TV, 2.

Connect a Sky+HD box to it, and 3. Say 'wow!'

Premiere

HCC's guide to what's happening in the world of TV and films...

Hired gun

Does anybody really want to see another lame Hitman movie? Well, some deluded studio exec at 20th Century Fox seems to think so, as they've only gone and hired a writer to knock up a script for the damned thing!

Stoppable

Sticking with Fox, the studio has reportedly put the brakes on Tony Scott and Denzel Washington's ironically titled runaway train thriller *Unstoppable* due to budgetary concerns.

Where-wolf?

An American Werewolf in London is the latest horror classic to be targeted for 're-invention'. Dimension Films is keen to revamp the franchise, possibly with a series of films about said werewolf turning up in different locations around the world. They must be howling mad.

More Basterds?

Producer Harvey Weinstein has already been talking about the possibility of a sequel to Tarantino's latest, claiming, 'Brad wants to do *Inglorious II.* We all want to do it. And the movie hasn't even come out yet! But unfortunately I can't give away the plot'.

Double-up

The Academy Awards are going through a bit of a shake up at the moment. From next year there will be not five, but ten nominees for the Best Picture category. Great, that's even more DVDs that'll have massive 'Nominated for Best Picture' banners plastered all over their sleeves.

High Definition Home

In the same way that film makers go to great lengths to create spectacular, unforgettable movies, DSE invests all of its effort and expertise to ensure that your new home cinema is a sure-fire blockbuster.

This means not only sensational sound and vision for captivating movies, games and TV, but a complete design, which balances the best use of precious space with excellent décor to endow a now stunning room with the perfect ambience.

Whatever your taste and wherever the space, we'll help you to find a home for the ultimate HD entertainment experience!

To find out more, please call 0191 491 4141 info@dsegroup.co.uk dsegroup.co.uk

Installer of the year

A recent project involved the dramatic transformation of a typical loft into a spectacular cinema media room.

POINT OF VIEW

Richard Stevenson is shocked and delighted that a mass market electronics retailer is singing the virtues of home cinema

y world is all about movies.' It was a one-liner on a TV commercial and it could just be the saviour of home cinema as we know it. Over breakfast mid-week, in front of 11.4m people, I watched in slack-jawed astonishment as PC World leapt headlong into a market that most of the big High Street chains have put on the back burner. With a bold message explaining how great home cinema is and how PC World can ease you into it with the minimum of hassle, the ad wheels out Christian Slater, saying: 'It's just like being at the movies. All I need is a popcorn maker now.'

Even in the middle of breakfast, I was forced to stand up and salute PC World. The commercial didn't follow the formulaic style of promising great deals on discount TVs, or 'buy now pay later' schemes. It focused on the benefits of home cinema, the excitement, the passion and the family experience: 'The special effects, the sound, they blew me away. I download loads of movies on my PC, and my wife always says, "Why can't we watch this on the TV?" So I went to PC World and they showed me how to stream movies from my computer in the study to my TV in the living room — wirelessly. They also installed a home cinema system for me. It's amazing.'

Okay, I have no idea why our floppy-haired narrator turns inextricably into Christian Slater for one line or why his wife scarily has the same male voice, but even I can forgive the fickle whims of advertising execs in this instance. As maligned in last issue's *Point of View*, the world has gone vision-centric, the yoof of today hasn't any interest in home cinema and families feel home cinema systems are simply too big or too complex. The PC World advert tackles this mass market malaise head on, selling the sizzle of home cinema excitement above the sausage of discounted AV products. Inspired, audacious and deserving of much success.

With much gusto, I drove to Tunbridge Wells and bounded into PC World's superstore for a hearty dose of home cinema enthusiasm – and Christian Slater's autograph on an old copy of HCC, if possible. Unfortunately, by the time the concept had got to the shop floor the sizzle had somewhat fizzled. There was a reasonable display of low-end home cinema package systems from the likes of Panasonic, LG, and Sony, and in terms of customer service I can't fault the two staff I spoke to. Both were helpful, friendly, and reasonably clued-up to the top-line benefits.

But it all went a bit awry when I asked some deep and meaningful questions – the sort any punter might ask if he/she did a bit of 'net-surfing for home cinema info before heading to the store. Can I stream the new HD audio formats from my PC to an AV amplifier? I've heard about HDMI v1.4 – what benefits will that bring and should I wait? Does this system support 24p video with x.v.colour? Actually, what the hell is x.v.colour? I didn't get any quick-response answers but people were dispatched to find out, the home install offer was fully explained and I got a brilliant tip about using shareware to rip my Blu-rays to hard disk.

Perhaps my questions were a bit nasty for a retailer going the extra mile to bring the benefits of home cinema to the mass market. PC World is investing advertising budget, shop-floor space and staff training on bringing the average man in the street a converged home entertainment solution. It might not be high-end, nor come with the polished presentation or technical expertise of a specialist store, but it could well re-kindle mainstream enthusiasm for movies and surround sound at home. And for that reason I love PC World. And I never thought I would see the day I wrote that

DVD ADDICT

After a day at a consumer electronics show, **The Beek** is worried that the beauty of Blu-ray is being ruined by new technology

espite what regular readers of this column may think, I'm really not a miserable old git. Well, not all of the time. I'm just someone who is really passionate about movies – be it watching them on the bigscreen or replicating that experience at home in the best way possible. And it's the latter that causes the problems, because every month it feels like I come face-to-face with people who are determined to make things harder for consumers to get a truly cinematic experience in their living room.

This Summer I spent a day, as always, at the CEDIA Expo at London's ExCel. While it's not always a hotbed of breaking AV news, it's still a great chance to see kit in action that manufacturers have only teased us with in the past, and to catch up with the retailers and installers to see how things are going out there in the real world. But my visit this year has left me feeling a little uneasy, and it's nothing to do with the hoards of desperate, identikit X-Factor wannabes queuing outside for the auditions that were taking place at ExCel on the same day.

My unease began at a projector demonstration from Optoma. The company was showing off its new ThemeScene HD86, and as Senior product manager Justin Halls guided us through the PJ's advanced feature set, he spent considerable time talking up its PureMotion2 frame interpolation technology. To demo exactly what this meant for consumers he spun a scene from the Blu-ray of *The Chronicles of Narnia: Prince Caspian*. Or at least, that's what he said it was. It certainly seemed to be the same movie I once reviewed for this mag, but there was something a little off — it didn't look like a film, but more like an American TV production.

To prove how good PureMotion2 was, he then accessed a mode in the HD86 that splits the

image in half – one side showing the image with the tech in action, the other with it turned off. 'Look how much better it looks,' said Halls.

I agreed with his words, but for me they were aimed at the part of the image that didn't use the PureMotion 2 technology - here was a Blu-ray being shown as it was supposed to look! Running at 24 framesper-second (remember how we demanded true 1080p24 support from BD players back in the early days?), not with added frames that manage to both smooth the image movement and produce an effect not dissimilar to those old Benny Hill sketches, where they would speed up the action of him being chased around by sexy nurses. Sure, the frame interpolation enhanced detail during camera pans, but turn your head from side-to-side and see if everything you see is pin-sharp as you do it. The world just doesn't look like that.

Returning to the CEDIA show floor it seemed that pretty much every projector, TV and monitor on display was also showcasing Blu-ray film content, but ruining the image with proprietary motion-smoothing wizardry. And it all looked bloody awful, being the complete antithesis of Blu-ray's raison d'etre — which is to accurately replicate the director's vision in your own home. Not to add frames, smooth it out and make it look cheap and unnatural.

I'm not completely opposed — there's probably a valid place for it with TV content, especially the sporting events it was touted as being so suited to. But it has no place having anything to do with movie content delivered by Blu-ray, and you'd hope that the pro-installer and manufacturers at events like CEDIA Expowould know that •

Just for the pure performance.

The TD725sw gives you nothing but bass delivered in sharper time and accuracy. It's the only way a performance should be heard. Recommended and awarded by HiFi+, it's the perfect accompaniment to your speaker system. Visit **www.eclipse-td.net** to see how Time-Domain technology lets nothing get in the way of your sound.

DEEP FOCUS

Hollywood insider **Jon Thompson** is concerned that not all IMAX cinemas are being created equal

or the ultimate cinema experience, you need a big screen. And traditionally they don't get bigger than IMAX. London's BFI IMAX (pictured) is one of the best, with its 20 x 26m screen and 11,600W sound system. Seeing The Dark Knight at the venue blew me away. Nothing was wanting, the picture was cinema at its finest (Wally Pfister is the boss, what great cinematography!). This Batman sequel has sequences shot with IMAX cameras. The IMAX original negative was cut into the IMAX DMR'd 35mm footage, creating an epic viewing experience: 70mm, 15 perf. This is how films should look.

Which is why some film fans Stateside are getting a bit upset with what appears to be a watering down version of IMAX appearing, called IMAX Digital. When actor/comedian Aziz Ansari went to see Star Trek: The IMAX Experience at the AMC Theatre in Burbank he was annoved (having paid a \$5 ticket surcharge for the IMAX presentation) to discover that the IMAX Digital screen was only slightly larger than a normal movie theatre screen. Expecting a screen on the scale of IMAX theatres like those found at London's South Bank or New York's Lincoln Square, he went home and unleashed his anger on his popular blog - and his rant, which urged a boycott of IMAX, was quickly picked up by hundreds of other bloggers and websites, including Ain't it Cool News, Movieline, Hollywood Daily and TechRadar. Virtually all agreed with Ansari's criticism of the smaller IMAX Digital theatres.

How big is big?

I think he has a point. Not only are the IMAX Digital screens much smaller in size, but also a much lower resolution. IMAX Digital currently uses two 2K-resolution Christie projectors to project two 2K images over each other, producing an image that is potentially of a slightly higher resolution than

common 2K digital cinemas. Yet in the US, AMC plans to install Sony 4K digital cinema projection systems in all its 309 theatres and 4,628 screens by 2012. So why would anyone want to pay \$5 more for a lower resolution theatrical experience?

Admittedly, the IMAX Digital system projects an image that is bright, with good contrast and with slightly better resolution than other digital projectors. But it also seems to have a noticeable 'screen door effect', that is, a visible dark grid pattern separating the pixels. It is particularly noticeable in lighter image areas, and less visible the farther back you are from the screen. Of course, if you move back to eliminate the pattern, your field of view narrows, and the picture looks no different than an ordinary movie theatre.

Less than 12 hours after Ansari's original Twitter message, a fan in Tennessee started a website called Liemax.com, which featured a Google Map with markers for, in his opinion, 'real' and 'fake' IMAX theatres in the US. A consumer war had begun.

IMAX responded by touting the performance of *Star Trek* on IMAX screens, claiming 'IMAX did 15 per cent of *Star Trek*'s total domestic box office in the whole country on only 138 screens'. Ansari shot right back with, 'What a surprise. Another IMAX lie. Who did those numbers?' He closed the post by challenging the IMAX CEO to a TV debate.

A day later, Hollywood heavyweight *Variety* had the story, and quoted Gelfond: 'We are going to do something [about the complaints]. We hear the people.' *Variety* writer David S. Cohen closed his story with, 'Maybe they can take a cue from Coca-Cola, and dub the old screens Imax Classic.'

IMAX Digital screens are also popping up in the UK, so make sure you know what the deal is before parting with your hard-earned cash

Has your IMAX experience been a wow or was it found wanting? Let us know; email hcc@futurenet.co.uk

Grindhouse geek

Expletive action:
Now just (bleep),
(bleep) and
(bleep), then turn

Including Inglourious Basterds, his long delayed WW2 homage, Quentin Tarantino has only directed six feature-length films in 17 years. It's hardly prolific. In comparison, Woody Allen has helmed 17, and even Uwe Boll has made 15. Yet, it is to the man and his movies' credit that even this meagre amount has seen him lauded as one of the greatest directors of the modern age. Indeed, his lack of productivity could actually be attributable for the quality of his output, Genius takes time — ask Terrence Malick.

There's another reason to be grateful for the gaps between his directorial projects — if he were to bang out movies like a modern-day Ed Wood Jnr, we'd never get to savour the rest of his talents. For instance, Tarantino is more than just an innovative director, he's a creditable story teller with an astonishing knack for dialogue. Tony Scott's *True Romance* and Oliver Stone's *Natural Born Killers* were both penned by QT, and it may come as a surprise that the screenplay for

middle-of-the-road submarine thriller *Crimson Tide* was given a polish by Tarantino during his post-*Pulp Fiction* days (hence the inclusion of a rather superfluous conversation about comic book hero The Silver Surfer). More recently he even wrote and directed two episodes of *C.S.I.*

Tarantino's acting career is also widely varied, albeit much less acclaimed. His performances in From Dusk Till Dawn and Desperado (both directed by pal Robert Rodriguez) are certainly on a par with the consummate appearances in his own movies. And, Little Nicky and The Muppets' Wizard of Oz aside, his presence in a film invariably whips the internet movie community into a frenzy. Indeed, even his name across the top of a poster (such as with Ong Bak) can cause fanboys to foam and froth.

Filmaholic

And that's the rub. Quentin Tarantino appeals to the fanboy in all of us, because he is a fanboy, too. The reason he has such an encyclopedic grasp of cinema is because he loves movies. When asked if he went to film school to learn his craft, he responded, 'No, I went to films.' And there is no better way to learn than that...

Quintessential Tarantino... QT courts controversy with Reservoir Dogs...

I 'It's amusing to me...'
Left alone with Marvin the cop, Mr
Blonde decides to have a little fun
with a straight-razor.

2'... to torture a cop' After a spot of dancing to Stealers Wheel's Stuck in the Middle with You, he grabs Marvin's head....

3 A close shave
... and goes to work on him with the

are left listening to Marvin's screams

4 Ear we go
As the screams die down, Mr
Blonde walks back into shot
holding a bloody ear

Must own...

Pulp Fiction:

Buena Vista → R2 DVD
Collector's Edition → £18 Approx
The definitive Tarantino film, this time
twisting crime drama reinvented Bruce
Willis, resuscitated John Travolta's ailing
career, and immortalised Samuel L
Jackson as a gospel-spouting hitman.

O8.07: 'And you know what they call
a Quarter-Pounder with Cheese in
Paris?' The first of many, endlessly
quotable lines..

48.02: Travolta does what he does best and struts his stuff on the dance floor with Uma Thurman in the Jack Rabbit Slim's Twist Contest.

From Dusk Till Dawn

Buena Vista → R2 DVD Collector's Edition → £18 Approx This features QT's biggest acting role to date, and the material he wrote for director Rodriguez is solid gold. A treat for schlock horror fans everywhere.

OO.01: Right from the start this R2 two-disc edition improves on its US counterpart by actually delivering an anamorphic transfer.

54.40: Salma Hayek in a skimpy bikini doing a sexy snake dance – surely cinema doesn't get much better than this?

Kill Bill: Vol. 1

Buena Vista → Region B Blu-ray £24 Approx

The first (and best) part of Tarantino's homage to the kung-fu flicks he grew up with.

OO.14: The use of the old 'ShawScope' logo at the start of the film allows QT to salute his major influences.

75.22: Soaked in the blood of her enemies, The Bride takes on the Crazy 88, accompanied by dazzling lossless PCM 5.1 audio.

90.15: The Bride and end-of-level boss O-ren Ishii face off in a breathtaking, snowbound swordfight.

Reservoir Dogs

Lionsgate → Region-free Blu-ray £25 Approx

The film that made Tarantino a firm favourite with the critics, this low-budget crime movie owes plenty to Ringo Lam's *City on Fire*.

OO.13: 'The entire song... it's a metaphor for big dicks'. Tarantino establishes his fondness for crude, pop-culture infused dialogue.

52.23: The notorious ear-slicing scene (see Quintessential Tarantino, above) **91.04:** With 1080p visuals, it's easy to see that Harvey Keitel's Larry really does shoot twice in the final standoff.

Worth seeing...

Jackie Brown

Buena Vista → R2 DVD Collector's Edition → £18 Approx Turning his hand to adapting an existing work, Tarantino delivers a more mature and character-driven piece than usual with his take on Elmore Leonard's popular crime novel.

06.11: 'AK-47, the very best there is...' Even though he's adapting another writer's work, QT still brings in his own distinctive dialogue.

43.51: The anamorphic 1.85:1 DVD transfer does its best, but the interior of the Cockatoo Inn, bathed in red lights, struggles with artefacting.

Natural Born Killers

Warner Home Video→ All-Region Blu-ray → £20 Approx

Tarantino hated director Oliver Stone's revamp of his early script, but he's wrong – there's plenty to enjoy about this controversial tale of murderous lovers on the lam.

09.44: The videotape visuals for the sitcom-styled *I Love Mallory* flashback hardly brings out the best in the 1080p VC-1 encode.

84.25: "I'm just a natural born killer". With that immortal line Mickey instigates the climactic prison riot.

True Romance

Warner Home Video → All-Region Blu-ray → £18 Approx

A pre-Reservoir Dogs Tarantino script provided the basis for this brilliant Tony Scott thriller about love, drugs and getting away with murder. Christian Slater hasn't been this great since.

25.52: The Blu-Ray's Dolby TrueHD 5.1 mix cranks up the atmosphere with pounding bass as Christian Slater's comic store employee pays a visit to Drexl the pimp.

108.07: If it's an early Tarantino script, it has to end with a three-way shoot-out.

Avoid...

Death Proof

Momentum Pictures → All-Region Blu-ray → £25 Approx

While not a complete failure, Tarantino's grindhouse homage struggles to balance the good stuff (car crashes and car chases) with the bad (endless scenes of people talking about nothing).

51.04: Stuntman Mike puts his 'death proof' car to the test, resulting in a spectacular crash that has glass shattering around you and crunching metal reverberating through the mix. **93.12:** This epic car chase allows QT to

wallow in fast-paced action.

RECAL 20 tips, tweaks

During the height of summer there's no better time to lock

Martin Pipe says it's easy to make big improvements

Clean your discs the smart way

That sprawling disc collection is a large investment, so treat it with respect. Handle a disc by its edge, to avoid oily fingerprints that could interrupt playback, and if you have to clean it, gently wipe it from the centre to its outside edge with a lint-free cloth. This motion is at right angles to the disc's microscopic spiral track that carries the all-important data, so there's less chance of scratches causing errors. Never wipe with a circular motion!

Oh, and always replace them in their boxes after playback. Obvious, really.

2 Go green – and save money too!

Maplin is just one of many outlets that sell a range of inexpensive power monitors that will tell you the energy consumption of your equipment. Use one to identify the worst contributors to your electricity bill, and in some cases, work out where you can improve matters. It's also worth checking your kit's menus for power-saving modes. Some DVD recorders, for example, offer a low-power standby mode that sacrifices features like Scart loop-through for minimal energy drain.

There is also a gadget called a Wattson, which is available from some websites, such as Firebox, for around £100. It can monitor power usage by wi-fi.

3 Invest in a calibration disc

If you haven't calibrated your system, then you're simply not getting the best from it. Invest £20 in a copy of Digital Video Essentials (available on Blu-ray and DVD) to get a reasonable standard of calibration without the need to hire an ISF-trained professional. DVE takes you through the process on a step-by-step basis, using a series of simple test patterns. Special glasses are included for colour adjustments, and the disc also contains some specially-shot footage and some useful audio content.

4 Rethink your

Are you using the best connections? From good to bad, the options are HDMI/DVI, component, RGB Scart, S-video, composite phono/Scart and UHF/RF. In other words, use HDMI whenever possible and avoid any unnecessary conversion between analogue and digital. Older HD ready sets might only have one HDMI input, so buying a (1080p24 compatible) switching box makes sense. If both Blu-ray and Sky+HD or a Virgin Media V+ HD box compete for the available socket, use HDMI for the former and hi-def component for the latter as there will be little to no drop in picture quality.

BRATE & tune-ups

yourself away with your AV kit and tweak your system. with only a modicum of effort

5 Invest in surge protection

It may not seem glamorous, but investing in surge protection makes sense. Mains surges can affect performance and, in the worst cases, can cause erratic equipment behaviour, or even damage - a lightning strike on a nearby power distribution line, for example. Consider a mains distribution board with mains filters and surge suppressors - they're frequently sold for use with computers. The surge suppressors absorb or short to earth the mains 'spikes', preventing them from reaching your equipment. You may want to go the whole hog and invest in a mains conditioner with in-built protection, such as one of Belkin's Power Consoles.

6 Make sense of your sonic options

With recent equipment, chances are that you're using HDMI to send audio and video to your display via your AV receiver. But what about those with older systems? If you're using an optical or coaxial digital cable to feed your amp from a DVD player, ensure the latter is set for 'bitstream out'. That way, you'll get discrete surround (DTS/Dolby Digital). It's surprising how often users get this wrong. An AV amplifier can do no better than Pro-Logic if the DVD player is only supplying it with two-channel PCM. Sky+HD subscribers should select 'Dolby Digital' from the sound settings menu. Confusingly, two-channel audio is available via the HDMI out of a Sky+HD box.

7Get into sticky crafts

Craft products may seem an unlikely AV ally, but they can be invaluable. Self-adhesive felt pads, which can be stuck onto the feet of equipment to reduce furniture scratches, as well as the transmission of unwanted vibrations, are particularly inexpensive. Our pictured pads (above) came from a 100Yen shop in Tokyo (for about 70p) but you'll find them widely available in craft shops and DIY superstores. Self-adhesive Velcro pads from similar outlets will allow you to mount small devices like aerial amplifiers, HDMI switchers, and networking equipment on to walls or skirting boards.

8 Keep your kit cool and clean!

Poor ventilation can slowly kill all manner of consumer electronics - so ensure there's always an airflow around it when you squirrel it away in furniture or racking. Some manufacturers recommend a distance of at least 10cm on all sides to ensure adequate airflow. Never place stuff on top of an AV receiver - those ventilation grilles are there for a reason. A yearly dust-busting session is always a good idea for all kit. Dig your components out and clean them down. A blast of canned air will dislodge heavy deposits from the inside of most hardware...

9 As blank media costs drop, migrate to better branded products

It makes sense to use decent-quality 'branded' blank media — TDK, Verbatim, etc — in your DVD recorder. It's not much more expensive than the unbranded variety and tends to have a longer life. How much are your personal memories or 'never-to-be-repeated' TV shows worth anyway? Your equipment will also last longer; the lower reflectivity and dubious servo tracks of cheap discs mean that your recorder's laser has to work harder...

Never waste a connection

The front-panel AV inputs on TVs are surprisingly useful. for transitory kit like gamesconsoles and camcorders. If you don't have any front AV inputs, or the available selection is too basic for your needs, then run cables from any spare inputs on the rear of the TV to a convenient location. Their 'free ends' can be connected to 'occasional sources'. When they're not required, protect them with a lidless pill-box. A selection of 'couplers' will cater for non-standard equipment (eg camcorders) with proprietary AV cables. DIY enthusiasts might consider making their own 'breakout boxes'.

15 Experiment with the ITU surround sound speaker globe

The widely accepted professional standard for multichannel speaker layout is ITU-R BS.775-1 – if your room allows it, why not give it a try? Here, the listening position is in the centre of an imaginary circle of between 4m and 8m in diameter (pictured below). The front speakers should be spaced by 60 degrees – 30 degrees on either side of the centre line. The rear speakers, meanwhile, should be placed within 100-120 degrees of the centre line. The front and centre speakers should be at ear height (approximately 1.2m), although an inclination of up to 15 degrees is allowed for the rears. Ensure that nothing is situated between speakers – reflections from such objects can blur the soundstage.

16 Toe-in your L/R speakers

Many left/right speakers benefit from being 'toed-in'. Here, the enclosures are angled so that their drive units directly face the listener. But getting the angle can be a bit hit and miss. A laser pointer is one way to achieve perfect directionality. Put it on top of your speaker, which can then be rotated until the laser's light shines on the optimum listening position. To make the job easier, you could prop up a dark cushion on your sofa to represent the listener! Alternatively, place a mirror over the speaker driver, and toe-it until a person in the listening position sees his/her face reflected.

17 Invest in an infra-red repeater

Some folks like to keep their equipment in cabinets appropriately ventilated, of course. Close the doors and you kill the distracting illumination of front-panel displays. But this usually means you can no longer operate the equipment remotely, because the infrared path is now blocked. Some equipment makes provision for external infrared sensors; these can be located outside the cabinet. Another option is to use an infra-red 'repeater' - these are available from Keene Electronics, amongst others - or RF sender/receiver combination and compatible universal remote control. The latter can even be used through walls.

Protect Freeview reception

There's nothing more annoying than having your Freeview PVR recordings spoilt by digital hash caused by poor reception. So while the weather is good, check your aerial is in order and get help if necessary. Also, make sure that any aerial flyleads are in good order – replacements are inexpensive.

Back in the living room, rotating the plug back and forth in the socket can dislodge any signal-sapping oxide on the pins. We also advise a periodic re-scan of your Freeview box (if it hasn't prompted you to retune automatically), to ensure that your receiver's database of channels is up to date.

12 Ditch those grilles

For the best possible fidelity, remove the front-panel grilles from your speakers — the improvement in transparency, notably at the treble end, can be dramatic. They're usually held in by plastic plugs that mate with holes on the baffles, and shouldn't need much effort to remove. But don't do this if children can reach them. They generally find the temptation to press in the soft domes of tweeters too hard to resist!

13 Subwoofer positioning

The placement of a subwoofer is influential in determining how it 'excites' the low-frequency acoustics of your room. Positioning is thus critical; from the listening position determine which location gives the best results - a 'natural' and consistent sound with no 'boom' or tonal 'holes'. Use a well-recorded music track with a good bassline - ideally one you know well - or LFE heavy sequence for a favoured movie during the process. Ensure that you also follow the manufacturer's guidelines for level, phase and crossover frequency.

Tame those

The aforementioned Digital Video Essentials features a very useful 'buzz and rattle' test, which sweeps (albeit quickly!) from 15Hz-300Hz. It's great for revealing rattles in your living room. These should then be tracked down and eliminated with extreme prejudice – judicious use of Blu-Tack can help if the offending object can't be removed altogether. Just find out why it's rattling and then stick it or plug it with the helpful putty.

Blu-Tack can also be used to isolate bookshelf-type speakers, reducing their tendency to vibrate other items, even the shelf they stand on, as well as improving fidelity generally.

18 Plan in-wall

If you're ploughing your spare time into a home cinema. room-conversion, here's a hint. Wiring is unsightly, and it's common to bury it in plaster so that it cannot be seen. Bury instead a section of foam pipe (typically pipe lagging), through which your cables can then be run. That way, it will be easier to add or upgrade cables in future. Avoid placing the cables in any plastic conduit that may rattle under sonic duress. If your home cinema room is in a top-floor room, consider running projector cables in the loft space. Use decent, flexible interconnects.

19 Use less projection power for better blacks

Using the low-power or 'eco' mode of a projector is thoroughly recommended. Our pictured BlackWing One LCOS projector from Cineversum is just one of many models to offer an 'economic' viewing mode. Not only will such modes extend the lamp of the (expensive) bulb, but power consumption is reduced. Best of all, the black level improves too! Indeed, you might find that the frequently-intrusive 'auto-iris' trickery can be disengaged. Naturally, the reduced brightness means that your viewing room should be darkened – consider installing 'blackout blinds' or curtains with a blackout lining to ensure you can use your projector throughout the summer months. At the same time, install some interior ambient lighting to reduce eyestrain.

20 Power down your sub

The automatic standby systems on active subwoofers, which turn them off when no signal is present, can be a little flaky. They can often stay on long after you've gone to bed. If your AV receiver has a switched mains outlet on its rear panel, consider powering the subwoofer from that. Turning off the receiver will then essentially disconnect the sub from the mains. European mains outlets tend to be used, so you'll need an adaptor - and possibly an extension cable.

If your amplifier lacks a switched mains outlet, consider using an extension cable or distribution block (power strip) with a convenient mains switch

An HCC reader guides you through his garage home theatre

Movies at your fingertips

Imerge's new iPhone app takes movie viewing to another level

Pod people: Imerge's controller app works on both an iPhone and an iPod Touch One of the most exciting things about the custom install industry is its ability to evolve. Perhaps unsurprisingly, this evolution occurs at a much quicker pace compared with the rest of the AV industry: you'd expect the apex of home cinema (and hi-fi) to adopt new practices ahead of the rest of the pack.

Take Cambridge-based Imerge, for instance. This innovative British outfit continues to push the envelope, adding new and exciting technologies to its existing modus operandi. Starting out as a music storage hard-drive provider in the late 90s, it developed the world's first hard drive-based audio server, the SoundServer – a kind of giant iPod for posh homes. In 2007, the company added movie storage, with the multi-terabyte, 1080p-capable multiroom MS5000 – important in home cinema installs – and in 2008 it launched the MP1000 MediaPlayer which, when combined with the MS5000, is a trendsetting example of how rewarding a home media server can be.

Now, completing the Apple serendipity, Imerge has added iPhone and iPod Touch control functionality to the feathers in its virtual, multiroom hat.

Controlling these vast storage hubs has always been something of a challenge, which is why there's a range of efficient, sexy and expensive controller options available (think Crestron and AMX, to name but two). Imerge users can now choose between Apple or Philips' interfaces. As we reveal opposite, the Soundserver S3000, MediaServer MS5000 and MediaServer MS1 systems are now controllable via Philips' Pronto touchscreen remote panels.

But it's the IPhone/iPod Touch control functionality that has us excited. Available only for the MediaServer MS1, it works in tandem with the system's GUI, and is available as an 'app' download for £18 (it requires iPhone OS 2.2 or later). Designed to enhance the experience of owning an MS1, and to provide an inexpensive alternative to a touch controller, the application works in two ways: 'Gesture' mode and 'Now Playing' mode.

The former uses iPhone's trademark gesture control to touch, drag, swipe and press – in order to control the onscreen Imerge hi-def GUI. The latter provides 'rotate to view' controls such as play, stop, pause, etc – with album and movie artwork. Touching the album artwork in 'now playing' mode reveals yet more music control options, and pressing the movie artwork reveals movie credits and all manner of interesting tidbits and info.

If your home media needs are big (and your home roomy), the app will support up to 16 zones of music and movies, and if you happen to be a southpaw, the 'left-handed' mode will make your life a lot easier too.

Bespoke waterproof TVs

For that touch of AV luxury, why not get a waterproof TV, from Aquavision's Bespoke Range?

Aquavision is offering interior designers and custom installers a 'made-to-measure' TV range for wetrooms! The Bespoke Range features an Aquavision waterproof television behind Mirrorvision or fully mirrored glass.

The glass panels are landscape or portrait, up to a maximum of 200 x 150cm, with six Aquavision screens ranging from 10-40in. The tailor-made TVs can incorporate multiple screens, back lighting, mounting holes, basin taps and even matching glass panels to create a whole mirror wall effect!

Lutron is installers' fave

Eight out of ten installers prefer Lutron, according to results from the CEDIA '09 Awards.

The CEDIA Awards, now in their third year, showcase some of the best installations Europe-wide. Eight out of the ten winning install category winners used Lutron.

David Graham, Managing Director of custom installer Grahams Hi-Fi, which won Best Integrated Home Under £100,000 commented: 'The programming tools that Lutron HomeWorks offers allow us to do things like program the shades to lower when the sun glares onto artwork in the early afternoon – allowing us to protect valuable artwork.'

Imerge and Philips unite

The best things in life are free – like Imerge's new software module for Philips' Pronto

controllers. Of course, you'll need to be an Imerge owner and buy a compatible Philips Pronto (around £300) – but don't let that get in the way of the good news!

Key features include browsing by artwork, track, artist, genre and year; Imerge TV GUI navigation; along with full metadata and artwork available over wi-fi.

Based on the ProntoScript platform from Philips, the new module controls Imerge's SoundServer S3000, MediaServer MS5000 and the top-of-the-range MediaServer MS1.

New Artcoustic stereo system

Artcoustic has attracted a lot of attention with its innovative range of wall-hanging

speakers. Speakers can be overprinted with any design (snaps of your family or other JPEGs) and make an interesting alternative to in-wall and conventional speakers. There's also an addition to the Artcoustic stereo range that's ideal for smaller rooms. It's the £1,150 Superstar Passive, which ships with a separate PA260 power amp and joins the original £1,400 Superstar Active system with its integrated 150W amplification. Prices include a Match System screen. The new passive system provides system builders with an option for more conventional connectivity.

A touch of frosted glass

A screen is not just a screen when you are in the company of Pro Display. Mirrors, switchable intelligent glass and adhesive sheets are the least of it...

Screen manufacturer Pro Display has come up with some interesting new products for those looking for a very different kind of projection screen. Designed for 'individuals who have a need to be different and a desire for the very latest in innovative technology', the collection includes optical front and rear projection screens, window projection films, switchable 'intelligent' glass and film, mirror screens, infrared touch screens, canvas art wall speakers and Soundpod audio transducers.

For those that need to turn any room into a cinema, the brand has produced a range of Self-Adhesive Projection Films for front and rear projection setups that can transform regular glass into a video projection screen — so you can watch movies virtually anywhere! Screen sizes range from 30in to 120in with prices running from £325 to £2,075, depending on the type of film required and the screen size

Also new are Pro Display's Optical Diffusion Screens and LCD Glass products. The former are hand cast in a special glass mould – a process that is far more labour intensive than other coated or extruded screens. The high gain, high contrast and transparent screens with sizes ranging from 32in to 138in. Prices vary from £495 to £3,850, depending on size and specification.

Meanwhile, the brand's LCD Glass Screens are manufactured using a special optical glass which reacts to an electrical current being passed through it, switching it from transparent to frosted. In its frosted state, it becomes a high definition rear projection screen! Sizes available include

40in, 50in, 62in, 77in and 92in; with prices from £2.125 to £5.495.

Finally, the brand has Mirrorvision, which combines with a frosted LCD panel glass panel to create a 'now you see it now you don't display that Snow White's step-mother would have been proud of. Screen sizes range from 10in to 57in and cost between £1,350 to £6,500.

And it doesn't end there. Coming in 2010 is the Platinum Vision, aimed squarely at the high-end of the residential market. Apparently this collection will include an array of limited edition solutions designed with the intention of bringing a sense of style and individuality to the AV sector. Hmm, we can't wait... •

Man in the mirror: LCD TVs hidden behind Mirrorvision glass are impressive

his award-winning Kent-based dedicated home cinema room evolved out of a whole house integration project designed and completed by the experienced team at Imagine This (UK) Ltd. Unusually, the cinema room wasn't part of the original brief from the client, but was instead requested after the first phase of integration was completed.

This provided the team with a unique challenge: to seamlessly integrate the cinema and associated technology into a whole house AV distribution and control system that had been finished about a month before work on this part of the project began. And as the install team started bringing ideas to the table, it quickly became clear that this was the one part of the entire project that the client was most excited about.

Cinema calibration

Keen to get the best performance possible, the client specified not only a Full HD cinema, but also insisted on one that would match THX and ISF specifications. To match the brief, the Imagine This team specified a Runco RS1100 DLP 1080p projector, which is capable of delivering exceptional imagery from both upscaled standard-definition content as well as native hi-def material. This was matched with a Screen Research acoustically-transparent 2.35:1 Multi Mask projection screen.

Imagine This Design Director Guy Singleton elaborates, 'As we finished the theatre, we calibrated the image for "ISF Day and Night" modes to keep the image crisp and full of detail. The sound was also calibrated to full THX standards

Room essentials

A Widescreen

The screen, from Screen Research, is 2.35:1, but has motorised masking to fit 4:3 or 16:9 images. It's certified by THX and ISF, too

B Pick a picture

The Kaleidescape Movie Server enables the owner to browse complete digital copies of his DVD collection, and then watch them upscaled to 1080p. For a true HD experience, the PlayStation 3 provides Blu-ray thrills

C Out of sight

The entire 7.2 surround system is fitted in-wall. The installers have specced units from high-end US brand Triad

34 INSTALL

using a sound pressure level meter to achieve what can only be described as stunning audio performance'.

For ease of use, and to easily partner with the AV distribution tech installed as part of the whole-house conversion, it was decided to use Kaleidescape Movie and Music servers as the primary content source for the cinema. For true 1080p Blu-ray support, the installers also decided to include a PlayStation3.

The Crestron controls make things even more easy and immersive. As you first climb the stairs to the cinema you are greeted by an in-wall docking station housing a TPMC-8X touchpanel. A swipe of your finger releases it from the dock and automatically raises the lights to the preset 'Take Your Seats' level.

And when the end credits roll. the Kaleidescape module tells the Crestron lighting to start increasing in brightness, so the audience can leave without falling over. The end result is a magnificent dedicated cinema room. One that the team at Imagine This can take immense pride in, and that the owner can enjoy, with minimum fuss, over and over again!

Master remote: The Crestron touchpanel handles all the AV, plus lighting, heating and air-con, too

D Let there be light

All the cinema lighting, including the funky low-level down-lighters, is fully integrated into the Crestron control system

E High-end PJ

Runco's RS1100 1080p DLP projector features the brand's own Vivix processing technology – and a rotatable badge, so it doesn't look odd fitted to the ceiling

F Rumble time

All five of the cinema seats are fitted with Crowson tactile transducers, which shake the seating to correspond to the LFE channel

G Big boy
This hulking pre-amp from Denon features Dolby TrueHD and DTS-HD MA decoders, THX Ultra2 certification, and Realta HQV video processing

H Even bigger boy

Driving the speakers is this monolithic amplifier, a cosmetic and technical match for the pre-amp. Our Tech Labs measured its five-channel performance as 350W (4Ω) so only consider buying one if you want insane levels of power and don't care about your energy bills

reating a dedicated home cinema with the ultimate 'wow-factor' is a challenge for any leading home cinema design company. But with a whole family of movie fans on the judging panel and an existing lifestyle cinema system in the property that could compete with any local Odeon, this project undertaken by the install team from Maven AV Ltd needed to be a little bit special.

According to Maven's Co-Director Rob Simmonds, 'The client's wish was for the biggest screen possible in a 4.5m by 5.5m room, with enough space to house between eight and ten cinema-style seats'.

Working alongside the client's property developer, the install team definitely delivered the goods. High definition Blu-ray content is projected at Full 1080p via a ceiling-mounted Cinversum Blackwing Two at the rear of the room, while the family's entire music and (upscaled) DVD content is accessible from Kaleidescape media servers. In addition to this, the Crestron controls even allow the user to view content from any of the 16 security cameras that are positioned around the property.

The family were obviously delighted with the results of the project, praising Maven for, 'a top-class installation... their attention to detail is outstanding and the cinema room is everything we imagined it to be and more.'

Room essentials

A Hidden speakers

The Artcoustic L/C/R speakers and two subwoofers are installed behind the 9ft acoustically-transparent ClearPix2 projector screen

B Lap of luxury

The eight motorised reclining seats offer the ultimate in film-watching comfort, including 'Heat' and 'Massage' modes, as well as built-in beverage holders!

C Shiny shiny

The dark-toned textured wallpaper used on the back walls contains a subtle glitter that Maven claims 'enhances the lighting wall-wash'

D Control made easy

A wireless Crestron TPS-6X Ísys touchpanel is as functional and easy to use as it is stylish

Ceiling fan: Pioneer's audio guru, British-born Andrew Jones, designed the brand's new in-ceiling range

ioneer believes it has a secret weapon in the war to become the speaker brand of choice for the growing custom installation scene: the reputation of its TAD subsidiary and a new range of startlingly effective in-ceiling speakers.

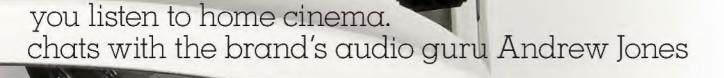

The company says it wants to become the sound of high-end home theatre, and is tip-toeing into the UK market. But the challenges it faces are considerable, and there's no shortage of big names already offering in-wall products (Bowers & Wilkins, Tannoy, Speakercraft, Definitive Technology, and Polk, to name just a few).

Yet Pioneer believes it has the edge in

experience (it began making loudspeakers in 1937), not to mention the reputation of Andrew Jones, designer of arguably the best-sounding loudspeaker in the world (the renowned TAD Reference One).

In the US, the brand's new custom installation enclosures come in two flavours: the Elite EX Series in-walls, and in-ceiling alternatives. Both use concentric Coherent Source Transducers, rather than conventional drivers, a technology filtered down from the legendary TAD cabinets. It's the in-ceiling models that the UK custom install industry has access to, in

the sound of Special S

the shape of the I-C631 and 651 models.

'The advantage our CST speakers have over conventional models is that as you move around the listening room, the tonal balance of the sound doesn't change,' explains Jones, Pioneer's director of speaker engineering.

This better off-axis response means the drivers are natural for AV use. We're chatting in a claustrophobic test chamber, deep within the bowels of Pioneer's HQ in Kawasaki. It's packed with enough amplification to pressure load a ballroom. Jones cradles one of his new in-ceiling models like a baby.

So why the two approaches?

'We wanted to show the best that could be achieved with the two different types of topology,' says Jones. 'The CST models give a very uniform delivery which is great for general purpose audio.'

Even a cursory glance at the new CST speakers reveals similarities with concentric rivals from Tannoy and KEF. So are they basically the same?

Jones shrugs. 'The devil is in the detail. Yes, concentric driver technology is a great solution to many problems, but there are many ways of implementing it: it's all about how you engineer the concept to get the best performance. With

42 ACCESS ALL AREAS

Tannoy, the tweeter is mounted behind the bass pole, so you can't get the same degree of time alignment. And then it's down to the tweeter profile, how it integrates into the baffle that adds to the performance.'

Material world

The TAD range uses Beryllium midrange drivers and tweeters, yet such exotic materials aren't specced for these models. Jones has instead opted for less costly materials with similar properties; the S-IW691L in-walls sport cones made of a carbon composite and aramid fibres, a synthetic weave used to make body armour. These are the same drivers as those used in the S-4EX speakers (reviewed in *HCC* #170) and claim a tonal match, which allows them to be mixed for those listening rooms where both free-standing and in-wall speaker styles are required.

I'm intrigued when Jones says that it's possible to create an entire surround system using in-ceiling speakers. Cinephiles might well be sceptical about positioning all the sources so high, but Jones is confident and demonstrations are surprising. One piece involves concert footage. 'The voice doesn't seem to be coming from the ceiling, does it?' asks Jones. And he's right, it images much like a standard L/C/R array, somewhere mid-screen.

I note that for the demo, Pioneer's engineers have mounted the front in-ceilings close to the

High altitude high-end: Pioneer's S-IC651-LP speaker uses CST technology

> wall, above the flatscreen; this transpires to be critical. 'The angle of that first reflection gets absorbed into the image and appears to lower the sound of the voice a couple of feet,' explains Jones. 'This means it's perfectly possible to use ceiling speakers for the front L/C/R. When you're watching a movie, your sight overcomes the impression of the location of the audio and locks the image into position. You get a pretty good impression that the audio is coming from the front rather than down."

Custom audio

I'm told that Pioneer got serious about developing in-wall/ceiling speakers for the custom install market about two years ago. 'We spent half of 2007 and all of 2008 working on the driver designs and moldings. Every part of the speaker is custom — custom chassis, custom cones, there's no off-the shelf parts at all. That's one of the advantages of working with a company of Pioneer's status. There's nothing we can't tool up for.'

Do you think all this attention to detail will be appreciated? After all, most in-walls look exactly the same...

'Yes, it's true. People don't look at design features on in-walls. There's no design freedom because people don't want design freedom. Customers don't even want a badge on them. But that can be an advantage. When it comes to the higher-end of custom home cinema, it isn't the brand of a speaker that's critical; it's the performance of the speaker. In the US market particularly, the actual branding of the system comes from the dealer. It's not about looking at a component that's important, it's largely getting good word of mouth for the custom installer. And he/she will choose based on what he thinks will give him the performance level and consistency in any particular install he or she might do.'

As part of an ongoing strategy, Jones tells me that Pioneer has kitted out a loft apartment in Hollywood with an entire range of branded AV kit – Kuro plasma screens, all the electronics, and speakers – and has been courting recording engineers, cinematographers and directors for their feedback.

'We've asked them how we can help their fans see and hear what they see and hear when they make movies. This new in-ceiling range is part of that process. We are producing what the people who are making movies and music want you to hear. The creative community in Hollywood is very supportive.'

Solutions

In-wall or out? The pros and cons of structural speaker design

If you're an AV enthusiast planning a home cinema room, and you can't decide which to go for – floorstanding speakers or in-structure models – what should be the deciding factor and what's the compromise?

We asked Andrew Jones,
Pioneer's director of speaker
engineering: 'Your wife!' he jokes.
'All the time I've been trying to
sell our EX floorstanding speakers
to people looking for a high-end
home theatre solution, they ask,
"What do you have for the
rears?" When I pull out our S2-EX
models, they'll say, "You're not
serious," they're huge! I can't
accommodate something like
that! Don't you have something
smaller or in-walls?""

'Well that's part of the reason why we've created EX in-wall speakers (currently available only in the US market). We're taking the self-same drivers which are in the EX floorstanders and transposing them into an in-wall solution. Because they're the same drivers with the same cross-over points, you get a very good sonic match, both tonally and phase-response wise. You can freely mix and match anything in the range, between S1, S3 and in-walls and get a consistent soundfield from them all.'

Only a phase: Tonal response rivals floorstanders

So can an in-wall or in-ceiling speaker sound as good as a standalone model?

Andrew Jones thinks they can: 'In terms of the overall sound quality, I think we've got very close to what we can do with the standalone box speakers. I've actually surprised myself. You can get pretty close to the full box experience with these models, and I am really happy the way they turned out. There are only minor differences in quality."

Certified: AV-holic!

Every issue, one **AV-Holic** invites you to take a tour of their beloved home cinema setup...

Seasoned pro: AV-holic Staf battles with his animé-obsessed son for control of the home cinema

Introduce yourself... Staf Heyndrickx, 45. How long have you been an AV-holic?

Ever since I bought my first VCR, about 20 years ago. Since then I've just wanted more and more. When DVD started to appear I waited just a little while and bought one – it's moved really fast since then. I was an avid Panasonic fan, but recently got a Samsung BD player in favour of the new Panasonic, and am feeling a bit sorry about that.

What's in your AV setup

A Samsung LCD TV Series 8 LE40A856; Samsung BDP-3600 Blu-ray player; Onkyo DV-SP506 SACD, DVD-Audio/ Video player; Digital TV from Belgacom (Belgian DTV provider); Onkyo TX-SR607 receiver; Xbox 360; and KEF 2005.3 speakers.

And what are your planning to buy next?

I'm set for now, but I might be tempted to buy an LED LCD TV...

How much do you think you've spent on your AV habit?

Literally thousands and thousands of Euros. It's too difficult to work out! Although it may seem a modest set-up, it all adds up to a big amount.

What does your family think of your hobby?

My wife likes it, and approves of it, as long as it doesn't cost me too much, so now and then I tend to change the numbers a bit. My 17-year-old son loves it, which is great — as long as he doesn't want to watch too many of his Japanese animé movies!

What's your current favourite DVD or Blu-ray disc?

At the moment it's still the Blu-ray of *Pan's Labyrinth*; great picture and sound, but there are many, many more...

Are you keeping an eye on future tech?

Yes, as long as things don't go too fast – you have to be able to enjoy your setup before thinking about what's coming next!

Room essentials

A Red devil

Samsung's LE40A856 LCD screen debuted in late 2008 with a then ultra-thin 44m depth

B New addition

Stan has recently installed this highly-rated Onkyo TX-SR607 receiver, perfect for handling hi-res audio soundtracks

C Game on

An Xbox 360 caters for the family's HD gaming needs, and movie-streaming, too

D Eggcellent audio

KEF's third generation of its iconic Egg speaker still uses Uni-Q tweeter/midrange technology to help create a wide soundstage.

A perennial favourite

Looking for the best Home Cinema?

Hear Your Films as the Director Intended

At Gecko, our house system is M&K's legendary 150 speakers, as used by Warner Bros, 20th Century Fox, Paramount, Universal, Dolby, Lucasfilm, THX, DTS, DreamWorks, Sony Pictures and Disney. Using these same speakers in your home will perfectly reproduce what the director intended and at a fraction of the price of other alternatives.

Professional Room Design

Over half of what you hear from any system is created by the acoustic of the listening room, so room design is an integral part of any system we create. Our acousticians design over 30 rooms a month and have the experience to ensure that your room has the perfect acoustics to let your system shine.

Compare the Latest Projection Technology

Gecko's showroom is the only place where you can compare all the latest projection and screen technologies from Runco, Stewart and Screen Research as well as far more affordable alternatives from JVC, Epson and VuTec. You'll be shocked at what you see and what you'll save!

The World's Finest Surround System

Finally, our facilities are the only place in the UK where you can hear the world's finest home cinema system. Steinway Lyngdorf's surround systems are unique in being able to perfectly reproduce the full resolution of high definition surround formats.

→ Hardware highlights PANASONIC Ultra-thin plasma with WirelessHD BOWERS & WILKINS Debut soundbar from Brit brand VELODYNE SPL-1200 Ultra subwoofer ARCAM Flagship 7.1-channel HD AVR VIBE 5.1 home cinema array from car audio legends TEVION DVD1100 Supermarket special 32IN GROUP TEST Six big brand LCDs go head-2-head AND MORE!

It's super-thin, comes with a separate media box, and claims to be friendly to the environment. But it's wireless Full HD that's the USP.

Rik Henderson explains all...

et's dispense with the foreplay, the Z1 streams 1080p24 wirelessly. Full HD Blu-ray video with no wires whatsoever. That's enough. Job done. Five stars. Now comes the padding.

Sitting at the top of Panasonic's Viera TV range, in both price terms and specification, the P46ZI is an object of tech beauty. It's sleek, svelte and unashamedly trendy. A metallic finish equals high-end in the TV business these days. And I approve.

To be honest, though, the ZI's aesthetic elegance comes as a bit of a shock. Panasonic is not generally known for its fashion sense. Cuttingedge kit, yes. Dependable devices, more often than not. Indeed, the company puts a lot of stock in functionality and we applaud the gesture – as the swathe of HCC Best Buy awards testify. However, as natty as they perform, they're normally shrouded in blocky, placky, black boxes. Built by inventors, designed by undertakers.

This set bucks that trend and sticks two fingers up at the gloss black purists. There's still a wee nod towards the company's ebony leanings with the adoption of two, oddly-placed, black strips down either side of the glass, but with the speakers attached, the screen is handsomely and entirely framed in brushed aluminium.

It's also super skinny. In fact, at 24.7mm at its leanest point, it is easily the thinnest plasma panel I've seen (to buy, at least). It's LED TV thin, which is impressive for a plasma. There are even some that would buy this TV simply because of its waif-like nature, but they would be best advised to read on, there is a drawback...

The WirelessHD functionality requires the use of a transmitter and

Evolving the plasma

The TX-P46Z1 is the latest in a long line of Panasonic PDP innovations...

2004

The TH-42PE30B was the first VIERA plasma TV and was launched to considerable

acclaim. It cost £3,700 at the time. featured a standard def panel and carried three Scart inputs...

2005

At a whopping 65ins, the TH-65PV500 was one of the first monster plasma screens

to hit the UK. It cost a staggering £9,000 on launch and also received a coveted Best Buy award in HCC 127.

2006

However, if we thought 65ins was massive, we were soon to be blown away by the gargantuan

103in 103PF9. It was awarded four-stars in HCC 139, and had to be craned into our reviewer's testing room!

2007

It was back to more manageable screen sizes, when Panasonic launched its

first Full HD 42in plasma panel (TH-42PZ700). We reviewed the 50in version in HCC 146.

2008

Who says size doesn't matter? In 2008, we saw the largest plasma TV yet unleashed onto

the world. The 150in panel sports a 4k2k resolution and was way too big to get into the HCC tech labs.

2009

And so we come bang up to date with the TX-P46Z1, the company's most svelte.

thin production plasma by far.

receiver, and the latter is bolted onto the back of the display. Therefore, the footprint, when mounted, is greater than expected - it sticks out approximately 50mm, twice the distance. That's still half the depth of, say, the Philips Cinema 21:9, but it undermines certain boasts.

In addition, the WiHD bolt-on isn't an aesthetic match to the bezel. It sticks out as a plastic anomaly. The end result is much like seeing Megan Fox with a massive, pustulant boil on her chin - you still admire the bodywork, but your eyes keep drifting towards the glowing lump.

Perhaps, though, that's a small price to pay for no wires, and those who are more adventurous than me may attempt to detach it and hide it out of sight, even though that's essentially against the point (it will still need to be wired to the HDMI port on the panel). It also doesn't look so bad when the set is sat upright on its stand (on a table), so maybe the add-on is not such a turn-off after all. It certainly does the job.

In the air tonight

Streaming Full HD video and high-res audio is no mean feat. It takes considerable bandwidth to ensure a constant and clean feed of 1080p24 footage over 10 metres, yet the gizmos here perform that task admirably. Not once during testing was the signal interrupted or hampered by additional artefacts. Admittedly, I remained within the recommended catchment area, but it is highly unlikely that, with a set like this, you'll set the separate media box more than 32 feet away.

And anywhere within that area offers as clean an image as a normal HDMI cable is capable. That's it. There's no more to it than that. To be honest, it's weird being so impressed by something actually doing what's it's meant to, but I am. And you will be too.

Of course, this isn't the first wireless HD TV system we've tested, Sony's ZXI has that honour, but that was only capable of streaming a maximum of 1080i video. This Panny beats it hands down in a game of AV Top Trumps. It also has the better media box, by a country mile.

WirelessHD aside, the separate media box is abundant with features and talents. A Freesat tuner is par for the course on certain Panasonic TVs these days, so its inclusion here, alongside Freeview

and analogue counterparts, comes as no surprise. Nor does VieraCast, the company's 'net streaming portal, although the latter has certainly expanded in usefulness since I saw it last

As well as a proprietary YouTube video browser and Picasa support for viewing photos (which have both been available since day one), Eurosport and Bloomberg have joined the party – for sports and financial news respectively - and there are weather reports too. It's proof of the system's ability for expansion and, while it's not as open a technology as, say, Philips' Net TV (with its full web browser), I certainly look forward to seeing other applications emerge over the coming months. The Z1 is capable of adding those as they become available.

The media box's LAN (Ethernet) port also allows the set to connect to a home network to stream JPEG pictures and DivX video from a similarly DLNA-certified NAS box or

Product:

Position:

flagship product. A 54in version also available

Peers:

computer. There's also an SDHC slot, which can handle AVCHD video stored on compatible memory cards. Weirdly, though, neither method can play MP3s. I have no idea why... Surely that's easier than DivX video? Anyone? Bizarre.

The ins and outs

Other socketry found on the media box includes four HDMI v1.3a ports (one of which is hidden under a front flap), a set of component jacks, and a couple of Scart in/outs (remember them?). There's also a common interface socket, but with Setanta Sports being the second-most talked about demise in June, there's little reason for its existence at present.

It is inside the box that you find, perhaps, the most interesting doohickeys. Panasonic has obviously afforded the ZI its premium picture tech, as also found on the flagship P50V10 reviewed last issue. Firstly, it utilises the company's NeoPDP plasma technology, including 600Hz>

HCC's test card has been designed to torture even the toughest screens...

A Grayscale
The rear pattern runs from 5% white to 100% black, and the P46Z1 had slight banding problems at around 60-70%, no matter what the settings

B Gold

Gold reproduction is a problem area for flatscreen TVs... usually. The Z1 displays shiny, gold objects with excellent realism

C Red

Plasma is far better at displaying true, deep reds than LCD, as the Z1 proves to great effect. The peppers and robot are both solid and rich

The cable-free society

HCC chats with the WirelessHD Consortium

Sending Full HD images and high-resolution audio over the airwaves, with nary a cable in sight, is a revelation. And the AV industry is so convinced in the technology's potential that it has banded together to form the WirelessHD Consortium, a global organisation to regulate the standards and specifications in order to provide certain consumer guarantees.

To earn the WirelessHD stamp of approval, kit, such as Panasonic's Z1 plasma TV, must meet certain guidelines, as Lianne Caetano, the Executive Director of WirelessHD, explains...

HCC: What is the WirelessHD Consortium and why was it formed?

Lianne Caetano: 'In 2005, a group of consumer electronics companies came together to discuss the optimal wireless technology options for home multimedia equipment. After thoroughly reviewing the common requirements, it became quickly understood that 60GHz wireless technology presented the best possible platform to address the growing bandwidth and application needs in home networking.

'In order to address this opportunity LG, Panasonic, NEC, Samsung, SiBEAM, Sony and Toshiba joined together to form the WirelessHD Consortium. In later years, they were joined by Broadcom, Intel and, more recently, Philips.'

HCC: What is the minimum specification required to be badged WirelessHD?
Lianne Caetano: 'WirelessHD has established a comprehensive compliance and interoperability

testing program available at authorised test centres. This compliance program provides consumers with confidence that their WirelessHD-enabled devices will comply with the standard and/or will interoperate with other WirelessHD devices, regardless of manufacturer.

'When a manufacturer decides to produce a product based on the WirelessHD standard, we provide them with two options. If they simply want to promote their product without the WiHD logo, they must pass the compliance test specification (CTS) parts one & two. If the manufacturer wishes to use the WiHD logo on their products, it must pass all three parts of the CTS.

'In other words, some products will be identified with the WiHD logo, while others will not, based on the preference of the manufacturer.

'Users will be able to identify which products have passed all three levels of our rigorous compliance and interoperability testing by looking for the WiHD logo. In either case, all will be based on a standard specification backed by some of the biggest names in the industry.'

HCC: As well as major brands adopting WirelessHD, is it possible that stand-alone accessories can comply with the standards?
Lianne Caetano: 'Absolutely. At this time, both LG and Panasonic are shipping their HDTVs with WirelessHD technology. In the fall, we anticipate more announcements from adaptor manufacturers. Adaptors provide consumers the ability to make their legacy wired equipment go wireless.'

HCC: With regular HD standards constantly changing, do your own standards change to suit? For

example, will you support 3D? Lianne Caetano: 'WirelessHD must keep pace with innovation; in addition, we will expand our application set. Since January of this year, we have been working on the next revision of the standard. At this time, we anticipate that WirelessHD 1.1, which will be backward compatible to WirelessHD 1.0, will support enhanced audio/ video capabilities including 120Hz, 3D, and deep colour, as well as 2 and 4K resolution. Additionally, we will have expanded data capability and plan to support high-speed data communications for mobile devices."

Lianne
Caetano

WirelessHD
Consortium

→Earning the badge...

Wireless 🖽 🕆

The key attributes of the WirelessHD specification include:

- → High interoperability supported by major CE device manufacturers
- Highest quality, lossless HD video, audio and data transmission, scalable to future high-definition AV formats
- → High-speed wireless, multi-gigabit technology in the unlicensed 60GHz band
- Smart antenna technology for reliable non-line-of-sight connections
- → Secure communications with DTCP and HDCP over WirelessHD technology
- Device control for simple operation of consumer electronics products using the standard TV remote control
- → Error protection, framing and timing control techniques for a quality consumer experience

Z1? You say...

Jeremy Davidson:

idea. Would I buy one? A big 'yes', but not at a premium. Other manufacturers should and will follow suit, they have to do so to make it a viable proposition. So bring it on but I a bigger say 65in or bigger.

Simon Kingsley:

The idea of wireless TVs is very good. My girlfriend, especially, is no fan of cable spaghetti! But if Panasonic is serious about selling the set, as well as the concept, then it has got off to a very bad start by telling everyone, 'Look! Premium TV and new technology! Too expensive for the likes of tou!'

Steven Stanley:

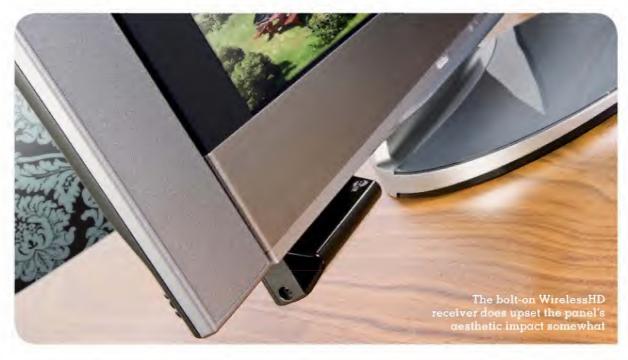

I would like to think that WirelessHD will become commonplace as it will enable a more organic room setup. My friend was purchase of a WirelessHD TV due to the design of his front room, yet the current offers are prohibitively expensive.

Bobby X:

Looks like a great TV but I don't think it can match the top Pioneers for picture quality. At this price I expect it to beat the

William Fazo:

Give me less wires – our world is becoming wire-free.

processing for smoother motion, a natural colour engine and fast response (which is especially good for gaming, or so claims the brochure). This set is also, like the V10, THX-certified. Basically, it has a THX colour and gamma-balanced preset that ensures images during movie viewing are standardised — to great effect. But there's one, final, function that this specific panel uniquely has that is perhaps the most impressive of all... picture calibration!

I almost fell off my chair when I found the advanced picture settings. The Japanese manufacturer has never offered such precise control on its UK panels before, even though mainland Europe has had them on some set iterations. This time, however, we're honoured with gamma presets and individual RGB sliders (for gain), all of which allow the tweakers amongst us to have a good crack at calibrating the video performance if they're not happy with any of the presets; certainly a welcome step in the right direction.

As is picture performance per se. Black leves are, perhaps, not the ZI's strongest point – at times, deeply shadowed sequences don't quite deliver maximum depth – but there is an appreciative trade-off. Colours are great. Scrub that... The colours are exceptional! And the dynamic contrast ratio, as tested by the HCC Tech Labs, is an incredible 72,457:1.

Back to the colours though, they genuinely are superb, especially reds. This is definitely an area where plasma beats LCD about the head and toilet parts. Where bold red objects, such as those found on Disney's CGI opus *Bolt*, can come across a tad orange with other TV technologies, plasma can display vivid, realistic hues, and the Z1 is incredibly proficient in this area. Its green rendering is masterful too. Basically, if you support Liverpool, next year's footie coverage will look amazing on this screen. Result!

It'll sound fine too. Obviously, wafer-thin speakers are no match up against any 5.1 system, but I've not heard many superslim TVs that are better at creating a competent and beefy stereo soundstage.

So the only downside is essentially those black levels, but I'm not so sure that's such an issue. They're as good as those found on just about every other plasma TV on the market, and a darn sight better than on any CCFL-backlit LCD. The major argument would be that the picture quality of this, not inconsiderably pricey, TV is not as good as on a Pioneer Kuro. But then, a Kuro doesn't have WirelessHD. It doesn't have VieraCast, or certification for DLNA. Or THX. It doesn't come in a super-slim package. Oh, and a Kuro is no longer being made. That's fairly important.

To compare a Pioneer Kuro to the Panasonic TX-P46ZI is like comparing a 1966 Alfa Romero Spider to a BMW 5 Series. Undoubtedly, the Alfa looks better and enthusiasts will boast about owning one, but the BMW has a swathe of modern advancements and you can buy the parts if it ever goes wrong. The ZI is a big step forward in TV design. End of

Monoliths hit a home run

Adam Rayner plays audio baseball with a set of classy tapered towers and a spherical woofer

ong-term readers will recall that the first ever fully spherical subwoofer was the Omicron, and it won an HCC award in its day. Back then, it came literally as a ball, with a round ring-shaped stand on feet. You rested the sub in it and aimed it how you wished.

Nowadays, Omicron looks like a Pokémon and stands on three stumpy excrescences. And now, Little Fatty has gone shiny, acquired some friends and has gone up in the world as a result.

Not just a pretty face

Having drooled over the photoshoot, you'll no doubt be wanting to know how well the system works. The answer is startlingly well.

I had a pair of the cast resin Monolith Threes (which look bloody gorgeous in a baseball bat kind'a way), which were scary to unpack. I wouldn't actually use the supplied white gloves - my advice is to just take off your jewellery, handle with moisturised hands, and polish them up afterwards. These are weighty items. The audition system also came with a stumpy pair of Monolith One rears, with rubbery cups to stand them endways, and a centre speaker, the Monolith Two, that came with two rubber rests. All the cabinets feature the same Kevlar midbass driver and silk dome tweeters and all are arrayed in the classic way -D'Appolito for the L/C/R and a simple two-way configuration for the rears. Of all the speakers, only the centre

Infinity TSS-4000; KEF KHT-6000 R&W VM6 box is sealed rather than ported.

I unleashed the Blu-ray edition of *Push* and the Vibes loved it. The film is great fun and a real slice of expert sound design. With empty space used as brilliantly as kicking new music and genuinely creative sound effects, the contrast is huge. The movie features 'Bleeders' who have a sonic psychic attack mode. The idea is, it should make you wither, and you do, to an extent. (While possible, Hollywood is not allowed to actually hurt you with pro sound systems in theatres. Shame...).

One Bleeder attack sees glass and fish tanks shattering in waves about the POV, and the rears are given a savage battering. Elsewhere, scenes in the streets of Hong Kong offer rich textures of realism and the Monoliths, although obviously not a hi-fi item, had ability way past what you might have thought, to look at them.

I have heard a plethora of 4in driver-based systems and while they all seem to specify well enough, most have yawning holes in the scale of their midbass and upper treble department. They simply seem unable to move or excite the air enough. But the Monoliths are different, as the boxes that house the 4in drivers are luxury accommodation, acoustically speaking. They are posh and sexily-shaped but as flexible and bendy as carved granite.

Poke a finger up the holes in the back of the Monolith One or Three >>

56 REVIEWS

and you'll feel a softly gas-flowed curve, as their port tubes are bent inside. The port is longer than the box size seems to want to allow. Movement of air to allow reproduction of bass is meat and drink to the Vibe's designer and the result he came up with works. Married to 'known good' tweeter technology all round with no compromises on driver quality as you get to the smaller models, and you have the result here.

Two things I dislike, though, are that while the Monolith Three gets super sexy high-end speaker wire terminals, the One and Two both get lowest common denominator parts.
As a reviewer I care more than
I should about this as, once fitted,
you'll not look at them again, and
I'm certain they are electrically sound,
but overall it still seems a pity.

The other thing is that the old Omicron subwoofer had an exterior amp and was deliciously madlooking as a result. The new one is far cuter but more sensible, with an 8in driver and mere 70W amplification. On the other hand, the Monolith Three floorstanders can rock. So when *Push* gets going and multiple gunplay and psychic thingies are all zoinging about, the Omicron sub was found to be wanting. It neither goes deep or loud enough to keep up.

The sub may be great for music but scary, deep bass and explosions aren't its forté. This is a shame as I know that Vibe the brand can literally hurt you with its bass (check out the Vibe Bass Tunnel on the brand's website, which uses 40 x 15in subs!). Personally speaking, I want to see a 12in beast with serious Class D amplification and a return to the older style of exterior amp.

The Monolith One and Two are cute and can make great systems of their own - where they will be perfect for the Omicron - but the Monolith Threes are just so cool. You get the plinths, with two double-ended male banana plug shafts and a bolt per speaker. The speakers' passive crossover bits are in a case in the plinth, where the WBT-style connection plugs sit. The tapering towers connect one positive each for tops and lows, and earth through the bolt. You connect the slightly asymmetrical banana plug shafts up, slide into place, and tighten the Allen bolt.

Stood next to the black chassis of my Panasonic plasma, they looked like they were born for it – dead sexy from every angle. You can mount the others on different sorts of wall brackets, too.

More bass please!

What we have here is a very good-looking designer system with real muscle and detail-resolution ability. It's ideal if you want a high-octane surround system. But it could be improved further. I'd want a Vibe subwoofer other than the Omicron myself, or maybe two, or better yet a mad great statement of a fifteen inch Omigodicron with 'Space' metal cone woofer driver and a stupidly big amp for £1,000. Then you'd be talking!

Little red devil

With a sporty paint job even louder than its woofer, this compact sub knows how to drive a room. **Jim Hill** takes it for spin

ost subwoofers tend to get shunted behind the sofa or disguised as a coffee table, but not Velodyne's. The Californian bass specialist designs boom boxes that stand out from the crowd, and its UK distributor Redline offers custom finishes in whatever colour you want for an additional fee. On test here is the daddy of the SPL-Ultra series, in an equally unsubtle Ferrari red.

But appearances are deceptive. The cabinet, although bigger than the 1000 (reviewed HCC #168), is still surprisingly compact. Its agile 12in cone can convey the slightest murmur as well as rising to the occasion when the volume goes up. What's equally impressive about the Ultra series, though, is the generous feature set that's been crammed into its glossy MDF cabinet.

Setting up a subwoofer is something of a dark art. If you don't get it right, it can sound very wrong.

Thankfully, with the SPL-1200 Ultra, you simply plug in the bundled mic, stand it in your viewing position, and press EQ on the remote. A series of bass sweeps are emitted that allow the sub to set its own equalizer to give you the best bass performance.

You can still choose the volume, phase and crossover frequency yourself, of course. It's best to set the crossover higher, between 80-100Hz, if your speakers are small or if you're using THX post processing, and lower if they are large, to get the smoothest transition to your sub.

A large LED display keeps you abreast of settings, changeable via the usual Velodyne credit card-sized remote zapper. These include volume, night mode and four listening presets.

So, this is an easy sub to set up, and with its wide frequency range it's flexible, too — in a mid-sized room it slotted right into a family of compact M&K speakers with little tweaking.

A relatively big 12in woofer like this takes a lot of driving, hence the fairly potent integrated 1,200W class D amplifier, which holds a reserve of power so it never runs out of steam. What you notice is a very smooth transition from a subtle whisper to a thumping explosion.

I put this agility to the test with the DTS-HD Master Audio of Valkyrie (Blu-ray), which packs everything from ambient music to exploding shells. I've tried bigger subs that manage more rumble for your money, but few that are so quick to deliver a punch and so accurately. You can turn this red devil up to 80dB with the remote control and it'll still sound in control – even while it's making your trouser legs flap. Impressive.

Heats up music

During its quieter moments, the 1200 manages to convey (heavy) footfalls with the same accuracy, and it's just as happy applying its fast response to music. It'll add warmth to any 5.1 musical score and get your feet tapping by punctuating the bass lines. Michael Jackson's *Thriller* on Super Audio CD sounds even more infectious than usual.

It's worth experimenting with the four preset sound modes at this point too. Perhaps surprisingly, I found the Jazz setting yields the best results, but it's nice to have other options.

This excellent sub's only real competition comes from its younger brother, the SPL-1000. Both models manage a similarly precise performance, perhaps because they share the same amplification, and the features are identical too, so you're really paying more for the bigger bass driver and cabinet. This gives a little more extension and would better suit a larger room. My advice is to audition the smaller sub first, but be prepared to trade up

LOOKING FOR A HOME

How easy is it to buy a home cinema system that suits you? You could read the magazine product reviews, find out who sells the recommendations, five-star favourites or best buys at the cheapest price and place your order. When the system is delivered to your door in the box, you get a friend who knows his onions to install it - and live happily ever after.

This is a fairly well-trodden path but it leads to dissatisfaction and a lot of wasted money. Besides there being a bewildering choice of components on the market today, there are also different ways in which components can be installed and connected together. Which sort of visual system do you go for? Projector and screen, plasma or LCD, an HD ready set or one with full 1080p capability? And on the audio side do you plump for a 5.1 or 7.1 speaker system, passive or active sub, and where do you site them for the best results? The choice of home cinema amp raises even more questions. Will you be listening to music through the same system? If so, you need an amp that approaches the performance of a decent 2-channel hi-fi amp, which is not that easy to find. Do you need SACD, DVD-Audio, or Blu-ray capability? How many inputs do you need for video, s-video, component, coaxial digital, optical digital and HDMI? The above are just a small percentage of the decisions that must be made. In short, it's complicated and very fertile ground for getting it wrong.

Achieving potential

To select a system, you could choose a collection of 'Best Buy' components in the hope that they will be a great combination. Maybe, but probably not. You could buy a pre-packaged all-in-one system from one manufacturer. This is almost certainly not the best route either as you will miss out on enormous potential. From informal surveys conducted, it appears highly likely that the majority of home cinema systems selected and installed on a DIY basis, that is without professional input, are performing at way below their optimum level. To compound matters, most are also ill-matched to the room in which they are installed and are, in reality, the wrong system. Without considerable knowledge or experience, high quality home cinema is not a suitable DIY activity.

Our aim must be to buy a home cinema system that will provide an excellent picture quality plus an audio delivery that will match, or even better, the commercial cinema experience. It must be exciting, reliable and deliver true value for money.

What and Where to buy

To ensure a home cinema system is right for you, where do you start? Here's an important tip ... don't start with WHAT, start with WHERE. There's only one way to give yourself the best chance of getting it right first time, and that's through a specialist AV dealer. It's possible you have preconceived ideas that put you off visiting one. Although you would welcome the advice and guidance, you don't know the technical jargon. You don't want to be talked down to. Your friend has said they only sell expensive gear and they're not interested if you don't have a big budget. They're expensive. These are just myths.

Most specialist AV dealers are running their business because, above all, home cinema is their hobby. They spend a large portion of their time comparing systems to get the best possible results. They know the component combinations which don't gel together and, conversely, they know the combinations which give the best performance within a given price range. Very importantly, they know how to get a system working to its optimum. But they all also know the system must suit you.

Raising the bar

B&W has launched its first high-grade soundbar, the Panorama, but, asks **Jim Hill**, can the brand's trademark magic survive the form factor?

here's no denying the convenience of a soundbar. Essentially an entire speaker system in one submarine-shaped cabinet, they are designed for wall-mounting underneath your flatscreen TV, with many offering technologies that simulate a 5.1 soundfield. But while they are certainly practical and increasingly popular, they also usually involve a sonic compromise, and I've found the results are patchy at best. So can B&W's high-end offering, named the Panorama, set a new standard for one-box cinemas?

There are design similarities between the Panorama and B&W's Zeppelin iPod hi-fi – not surprising as the latter was a huge commercial hit for the company, and proved it could turn out tuneful systems as well as studio-grade speakers. The Panorama shares its exquisite engineering, with tapering cabinets and a seductive stainless steel skin.

It's definitely the most elegant soundbar I've come across, but not the smallest. The unit is elongated to accommodate nine separate drivers and weighs over 14kg. Unlike most products of this type, the subwoofer is built-in and so is the amplification. A type C digital amp drives all five channels at 25W each with another 50W powering the sub.

So what you have is a 5.1 surround sound system, complete with

Product: 5.1-channel soundbar

Position: Unashamedly high-end, single bar solution

Peers: Yamaha YSP-40D; amplification and a neat pebble-shaped remote control to switch audio inputs. You could connect your TV and an iPod to one of the analogue inputs for example, and a Blu-ray player or set-top box to one of the digital inputs. What you don't get here, however, is any kind of video input, so you can forget about HDMI switching altogether. It would have been useful, but would also have added a whole new level of complexity and price.

Without video circuitry, the Panorama is easy to set up. Simply connect your source – in my case a bitstreaming BD deck – and you're ready to rock.

REVIEWS 63

The speaker is designed to sit on a table or fix to a wall via its own bracket: a switch in the menu recalibrates the speaker for each position. You'll need the little remote to do this from the sofa, so don't lose it. There's no onscreen menu, of course, but the Panorama's display is large enough to see what volume level you're on and toggle between stereo, wide and surround sound.

In surround mode, all six channels are active as the Panorama floods the room with crisp sound. The fronts and centre face directly forwards, while the rear speakers mounted on the curve of the speaker use the side and back walls to bounce soundwaves. With Battlestar Galactica's lively 5.1 mix (Blu-ray, on sale September), I got a good impression of Starbuck's Viper taking off and zooming through space. Without rear speakers the Panorama doesn't quite manage to place the craft behind my head, as a traditional 5.1 setup would – I've yet to meet a soundbar that can - but it does disperse the audio to create a tangible sense of spatial depth.

What sets the Panorama apart from its rivals is its refreshing clarity and impressive separation. With all those drive units huddled like peas in a pod, the sound could become muddled and compressed, but here it can really sing. Switching into stereo mode cuts out all but the front left and right channels and delivers a tuneful performance with twochannel material, and it still projects well into the room. Its dispersive nature means there's a wide sweet spot, so you won't lose the stereo image when you cross the room.

You can enhance the dialogue channel if necessary, but there's no real need - voices, effects and music all sound distinct in the mix and propel well into the room. You can also make basic adjustments to the tone to suit a space with hard surfaces or soft furnishings, which does make quite a difference. And the diminutive subwoofers are remarkably effective. I found myself dialling the level down more often than up, but it's nice to find a low frequency extension lurking in such a slim cabinet.

Untouchable

Despite the paucity of features (did I mention there's no radio tuner or iPod dock, or HD audio support?) Bowers & Wilkins' Panorama is a formidable soundbar debutante. I suspect it'll sell by the truckload .

Brilliant Britannia

Following thousands of hours of research and development, Arcam's first ever HD audio AVR has arrived. **Alvin Gold** says the wait was worthwhile

t often seems that British brand Arcam works in ways that are fundamentally at odds with other companies of its type, because while it has turned to Far Eastern factories to manufacture some of its products, the engineering remains strictly homegrown. You see, Arcam has a passion for generating its own often startlingly-innovative solutions for components that others can supply off the shelf, and this gives it a certain freedom that it has

long exploited, for example, in designing the only British cassette deck with Dolby S (in fact the only domestic cassette deck, full stop), the first DAB tuner, the first standalone D/A converter, and more. Not that all these products were successful commercially, some indeed were spectacularly mistimed – thankfully, the eagerly awaited AVR600 AVR isn't one of them.

This gleaming, beautifully-finished new addition to Arcam's FMJ stable is

If looks could kill: The AVR600 has the style to match its premium price tag a sophisticated AV receiver that follows a root and branch re-examination of the usual choke points of AV amplifier design, and introduces a number of key technologies to the Arcam range. It is the culmination of a three-year project, Arcam's biggest ever; the design alone involved writing 1.5 million lines of computer code.

The result is spectacular, unconventional and at times quite startling. Like some of its newer

rivals, the AVR600 sets out to tackle head-on the normally horrendous level of audio jitter that afflicts HDMI. Traditionally, audio in the HDMI interface doesn't have its own clock - it's shoehorned into the video signal waveform - and the challenge for Arcam was to reduce jitter to the level associated with good CD players, which has been achieved with some novel design courtesy of a new Wolfson SPDIF receiver, and some fancy footwork with the surrounding clock recovery circuits.

Lovin' Dolby Volume

Another issue with a home cinema amplifier is heat management. Multiple channels operating at once tends to mean very-hot-running amplifiers and losses of output power. What marks the AVR600 out is that it's a Class G amplifier - an analogue (not digital) technology that involves some clever jiggerypokery with the power supply

high-voltage rails, with the aim of minimising heat dissipation while

preserving sound quality and power

yield. The benefits are comparable to

AV/CV

Product: -channel HC Idio receiver

Positioning:

Arcam's only AVR sits alongside a range of ore-amps, power amps and processors

Peers:

Jally, IL sn't seem to saav – it's above the £2,000 flagbearers from Yamaha and Denon

those available from digital amplifiers in terms of heat dissipation and efficiency. This gives the AVR600 some green credentials, but without the collapse of power output into multiple channels heard with most analogue amplifier circuits.

In combination these developments give the AVR600 better power delivery and lower audio litter, but there is more to the AVR600 than these things alone.

Unsurprisingly, the Arcam packs the latest surround sound codecs aimed primarily at Mr Blu-ray user -Dolby Digital TrueHD, DTS-HD Master Audio and their associated stablemates, although passes on Dolby Pro-Logic IIz height processing and THX post processing. More unusual is Dolby Volume, a sophisticated compression technology designed to equalise sound levels, between programmes and ad breaks. This also transpires to be a genuine boon when mix and matching a variety of sources. There's also a Cinema Mode which crunches the dynamic range of a soundtrack together for late night listening. This should not be used as a default, as

the dynamics fall away.

The AVR600 is custom installfriendly, too, with multiple 12V triggers, IR receivers, multi-room/ multi-zone capability, and an almost insane array of inputs and outputs. The receiver can upscale (or even downscale if necessary) virtually any input from composite video to 1080p, as long as it is a legal operation not prohibited by mandatory copy protection issues. Of course, it supports USB based audio and iPods. In addition to an FM receiver, there's a DAB tuner and internet radio.

Performance

Although there are a lot of sockets, I encountered no special configuration problems with the AVR600; the uncomplicated (and graphically unambitious) user interface allows ready access to settings, with an easily understood front-panel control system. There's a simple-touse microphone assisted setup and an intuitive remote control. Much of my listening used Yamaha speakers - the Soavo-1 and Soavo-2 as front and rear speakers respectively, with >

Wot no Blu-ray:

Labelling of connections is somewhat odd – there's no HDMI designated for BD, yet there is one for a VCR an Onkyo D-312E, a two-way compact, pressed into service as a centre speaker (this model is a strikingly good voice match for the Yamahas), and a Monitor Audio PL-12 subwoofer. Blu-ray and other DVD replay came from a Denon DVD 2500BT transport, and an Infocus DLP projector was used. Finally, a pair of Monitor Audio PL-300s were plumbed in for two-channel stereo listening.

Digging into every aspect of the AVR600 will take a user some time, but the exploration should prove enjoyable. Working my way through the key features and operating modes yielded results which ranged from merely acceptable (the FM radio and, inevitably the DAB tuner) to hackle-raisingly excellent (most of the surround codecs, including Dolby TrueHD). The latter come into its own with Cloverfield, a bizarre but well-made piece of baloney, which is full of surprise changes of audio perspective and dynamic range. With a lossless codec like Dolby TrueHD. the Arcam is undeniably compelling, and occasionally shocking in a

With other more straight-laced material, including Blu ray versions of *Earth* (chosen primarily for its stunning visuals), and *Quantum of Solace* (which wasn't), the Arcam strutted its stuff well, and showed just what a thoroughbred it is.

way that Dolby Digital could never

hope to be.

Beneath the lid, the AVR600 uses a single IC featuring eight Crystal Semiconductor DACs; chosen for simplicity and uniformity of sonic quality. When asked why no Wolfson DACs, usually the preferred high-end option, Arcam revealed that its upcoming processor variant, the

AV888, will feature eight Wolfson 8741s. Not that I believe there is anything lacking in the Crystal designs. The AVR600 is an accomplished stereo performer, in its element with all manner of music, ranging from solo material (eg Suzanne Vega) to largescale choral stuff (including Brahms' Requiem). It's worth noting though that this model is not overtly musclebound.

HCC's tech tests tell an interesting story though. Our Power Output measurements confirm that while the AVR600 may lose out in a volume face-off, it has quality chops. We rated its power output at around 100watt with five channels driven, but it sounds a lot more empowered. Probably because, as our secondary Pure Power Fidelity Firewall measurement confirms, the Arcam will run at full-power without distortion. Other similarly specced amps may shout louder, but they pay for it in levels of THD.

Obvious Upgrade

There are some caveats, of course. The user interface is distinctly Arcam and the GUI is particularly spartan when you venture into the world of 'net radio, while the backpanel labelling is at best odd (no BD-labelled HDMI?). The model also has a tendency to POP loudly when switching sound streams between BD menus and lossless codes.

On the plus side, it boasts a well-conceived suite of video and audio technologies, gifted with a sound quality to warm the heart. For long-time Arcam fans, this is the most obvious of upgrades, and comes with an unreserved recommendation. And it may well convince others to follow. This truly is a receiver for all reasons

→ Tech Labs

Power consumption: Watts

Idling: Unsurprisingly for such a powerful amp, even when idling the consumption is enough to light the average living room Powered: In five-channel mode, power consumption jumps to 826w, indicating a reasonable level of efficiency

Kickass kinsman

Yamaha's seven-channel power pusher borrows all the best bits from its ultra-high-end big brother, the DSP-Zll, says **Richard Stevenson**

can understand why Yamaha's DSP-Z7 has come to be. The company's flagship DSP-Z11 is just a little too extreme for many. Extreme on the wallet, extreme on the features count, extreme in performance and extreme in its demand for loudspeakers – ideally 11 of them and two subwoofers. Back in the real world, where UK homes get ever smaller and low-clutter décor is

the prevailing fashion, the Z11 remains an awesome niche product at the top of its game. Only the well-heeled (who can have the system discreetly custom installed), or nutters need apply. Yes, I do have one.

Once Yamaha's engineers had recovered from their four-year power-trip creating the Z11, it suddenly seemed like a good idea to make a Z11 'lite'. Say, most of the Fascia the facts: Yamaha's fondness for an orange display is still present power, most of the performance, most of the features – only at half the price. They lopped off the last four channels, lost the THX certification and THX post-processing, cut back on the really esoteric components, slimmed down the power supplies and put everything in a smaller chassis. The result is the much more affordable and very appealing DSP-Z7.

REVIEWS 69

In fact, my blasé description of how the Z7 has been created is not that far from reality. This amplifier offers $7 \times 140 \text{W}$ as opposed to the Z11's $7 \times 140 \text{W} + 4 \times 50 \text{W}$, and almost every feature of its bigger brother and most of the connectivity. You still get four-zone multiroom, Ethernet networking and Advanced YPAO Room EQ — complete with the whacky mic-support plinth that looks like a tri-lobed boomerang. I did try throwing it — it didn't come back.

The onscreen GUI is also a hand-me-down, still looking pretty cool even if the competition for designer GUIs has become really hot of late. I suspect Philippe Starck and Lawrence Llewellyn-Bowen will have to be called in for the next round of onscreen display makeovers.

Under the hood, there is a swathe of big-name goodies from the likes of Anchor Bay and Burr-Brown, and a comprehensive tick list of must-have features on a two-grand amplifier. HD-audio bitstream decoding? Tick. Dual-output v1.3 HDMI connectivity? Tick. Comprehensive picture

AV/CV

Product:

Yamaha continues to allow you to switch the rear-channel output to its front 'presence' channels if desired. Ironic, then, that the Z7 doesn't yet offer Dolby Pro Logic IIz, which can drive front height channels.

I have now been around long enough for Yamaha's black fascia and orange display cosmetic to come back into fashion – for the second time. Twenty years on and I still don't like it. You can't fault the Z7's robust build and purposeful stance on the rack, though, and the drop-down fascia offers access to almost all functions should you manage to lose both the main and secondary remotes. Setup is fully automated – saving you moving the mic around – and the overall ease-of-use is none too bad at all.

YMCA

It's a little known fact that HCC's office theme tune is 'It's fun to play

with the YPAO, sung to the tune of Village People's YMCA. Not only has this been adopted as it allows Editor Steve May to wear his biker gear and leather chaps in the office, but also because Yamaha's Parametric room Acoustic Optimiser (YPAO) has proven to be one of the most effective room EQ systems on the market. The Z7's implementation is no exception, and, after running a simple three-position setup with the supplied boomerang stand, the results were subtle yet impressive. Gone was a slight room-induced boom around 50Hz, and the dip in the front-right channel - due to the sound disappearing out of my bay window - had been balanced out. YPAO isn't an overt filtering and boosting system that trashes fidelity, but a careful trimming of some problem frequencies to give a sprightly and detailed sound with plenty of punch.

Punch, in fact, is something that the Z7 has by the truck-load. The action sequences throughout the new edition Blu-ray of *Terminator 2*: >

Judgement Day explode out of the speakers with pace and power aplenty. The bass effects are massively potent but equally tight and agile. Gun shots are not just huge great visceral booms but each one is crafted with a complete mechanical symphony of moving metal parts, clattering ammunition and a reverberating thump in your chest. Basically, it feels like you have been shot; the Z7 has ample reserves of power to make things seem like the real deal live event and, given decent speakers, packs a dynamic range that makes most local cinema audio systems sound compressed.

Helped in no small way by T2's awesome DTS-HD MA 6.1 soundtrack, the Z7 turns watching this action-fest into a whole-body experience. It wraps you up in the story with its immersive presence. The soundstage is rendered as a tangible vista, with superb steering around the room, and even tricky outdoor scenes have great space and perfect ambience. From the top to the bottom of the frequency range the Z7 feels immensely sure-footed and in control. The result is a very solid, very tactile sound that left me ooohing and aaahing at the movie's sonic details.

Subtle sin

Yet the Z7 is not just a beef-cake, it can do subtle as well. With intense material, like the recently-released Blu-ray of *Sin City*, it proved to be light and agile with superb projection of dialogue. The moody opening scene on the roof top is delivered with all the dark presence of Basin City below. The subtle car noises, gentle breeze and distant sounds of people, guns and sirens are placed to perfection – painting the scene

as accurately as the blistering high-def picture.

This receiver's overall stance natural and detailed sound with a huge low-frequency punch - is right out of the DSP-Z11's list of appealing attributes. Where the Z7 gives way to its bigger brother is at the extreme ends of the audio picture. The Z11's ability to deliver fine detail, particularly very quiet effects, is absolutely extraordinary whereas the Z7 is simply very good. And in terms of creating the biggest, most impressive, surround sound experience possible in the home, the Z11 is the daddy. The Z7 gets damn close, though.

Inclusion of 'net radio functionality arguably makes the Z7 a receiver rather than an amplifier. The radio is slick to use, although I have seen systems using gateway servers with far more content. Web radio sound is never going to be hi-fi (at present at least) but Yamaha's music enhancer goes a long way to jazzing up the worse offending low bitrate stations.

The Z7's picture tweaking options will be a boon to those with mainstream (rather than high-end) Blu-ray decks and the Anchor bay DVD scaler is a distinct improvement on the chipsets found in budget BD-spinners, TVs and projectors. But do I really miss those extra four channels and esoteric audiophile components? Well, yes I do – but I suspect most people (and their partners) won't find the difference justifies the extra £3K.

At £2,000 the Z7 really is a top-notch performer, packed with features, easy-to-use and offering excellent sound. Okay, it's not exactly a Z11 on the cheap, but offers much of its bigger brother's magic at a fraction of the price. Bargain

→ Tech Labs

Power consumption: Watts

Idling: Not an excessive drain on the National Grld, but for long idle periods you'll want to switch it off completely

Powered: In five-channel mode, power usage soars to 1,1115W. Meaty but not excessive for the muscle delivered

Power ratings: Watts (8 Ω , 0.5% THD)

2-channel 8Ω: In two-channel mode this amp delivers considerably more than the claimed 140W per channel. It's a beast at 186W 5-channel 8\(\Omega\): At 103W per channel in five-channel mode, the amp's performance still stands up pretty well, although there's a juice shortfall

Media Centre monster mash

This massive Media Centre PC demands to be taken seriously.

Chris Jenkins wonders if old-school convergence is back in favour

ew would dispute the fact that the entertainment system of the future will combine the best attributes of both a TV and PC, but debate continues to rage about the wisdom of entrusting all AV needs to a Windows-based Media Centre PC. Tipping the scales of trust are those models configured specifically to handle your precious media files, and designed to look good in the living-room.

Such is the MediaPC4U system. Based on the SilverStone Crown CW02 case (available in black or silver), this system looks rather like a high-grade amplifier, and so won't look out of place racked with other AV kit. More to the point, it actually is an amplifier, with a built-in 5.1-channel surround sound processor/amplifier card.

The all-aluminium construction and extra-thick reinforced dress plates in the front set off a sophisticated design with a backlit LCD panel and two big control knobs, one for function and one for volume. Front panel sockets are concealed discreetly under a hinged flap.

The case is big enough to accommodate an extended length graphics card, a CPU cooler, and lots of drive options. **MediaPC4U** will assemble pretty much any configuration you want with prices starting at £1,099.

Ontions include a choice of motherboards. Microsoft Windows Vista Home Premium or Ultimate operating systems, different specifications of AMD processor, a choice of coolers, RAM from 1Gb to 4Gb, one to five hard drives of up to 1Tb each, optical drives including DVD-RW, BD and BD-R, a choice of TV tuner cards including dual digital models and the optional SiliconDust HD Homerun dual DVB-T Network Tuner, a choice of Asus and Sapphire graphics cards with up to 1024MB onboard RAM, a choice of power supplies and fans, and a selection of card readers. Phew!

All the motherboard options will support Blu-ray and HD-DVD playback, and the system comes with a Windows Vista compatible 56-button infrared remote control handset. Wireless network cards, wireless keyboards, soundproofing kits and cables are all available as optional extras.

Bit of a Diva

The system we auditioned comprises the SilverStone Crown CWO2 Media Centre PC Case, MSI Media Live DIVA 5.1100W (claimed) amplifier CPU, AMD 4850e dual core 2.5GHz processor, Western Digital Green Power 500GB hard drive, LG GGC-H20L Blu-ray optical drive, Windows Vista Home Premium 32-bit operating system, and Arcsoft Total Media Theatre 2 software for native Media Centre Blu-ray playback. We also had a SiliconDust HDHomeRun networkable dual tuner supplied by Nectar Electronics, bringing the total cost to £1.394.73.

Naturally, Windows Vista includes Windows Media Center, your control system for playback of digital video and audio files and, of course, you get all the other functionality of a modern PC.

Easy hooker

The HDMI connection on the graphics card makes it easy to connect to a TV. A rather more fiddly process is the speaker connection for the amplifier card. You have to screw the bare ends of the speaker cable into an edge connector, and plug this into the amplifier board slot, a little awkward, particularly if you have thick speaker cables.

The key to the system is the combination of a motherboard and five-channel amplifier that is otherwise known as the Media Live DIVA 5.1. It features a socket to support a range of AMD and Sempron processors, slots for up to 8Gb of memory, and slots for PCI graphics cards. The 5.1 channel audio amplifier circuitry features SPDIF digital and front audio pin outputs, and the video outputs include component video, VGA, HDMI and phono out.

PC connections include four SATA II sockets for hard drives, four USB 2.0 rear ports, four USB 2.0 pinheaders, plus IEEE1394 (Firewire), serial port, infrared, CD-in Connector, and LAN connectors. It supports the RAID format should you want to use a massive external drive system.

Multi-channel sound processing is handled by the Intersil DAE-3 chip, which, interestingly, is THX Ultra2

AV/CV

Antec Fusion Remote, Eclipse DM5 Media Live

76 REVIEWS

PC world: You can connect-up an extra long graphics card in the ample casing certified. This combines the functions of home cinema audio with those of a traditional video receiver, CD, DVD, DVR, cable box, HD TV tuner, and PC Internet connectivity into a single unit. A five-channel audio amplifier places a high demand on the typical PC power supply, causing voltages to fall and the system processor to reset, but the DAE-3 has a small thermal footprint and real-time power monitoring to prevent this.

In use, this multimedia monster is rather sprightly. The AMD Dual Core processor allows multiple programs to be run without stalling or stuttering. This becomes particularly important when you want to watch a TV picture while it is also running other software. The ATI Hybrid Graphics Card combines AMD and ATI Radeon chipsets to take on the load of graphics processing, and to enable multi-display functions.

Freeview for all

The Arcsoft Total Media Theatre software is intuitive and relatively easy to get to grips with, and I appreciated the provision of a dual Freeview tuner, which allows you to record one channel while watching another; time-shift; pause live TV; and use one-button recording.

You can play Blu-ray, DVD or CD discs in the optical drive, all under the control of the remote handset (an onscreen widget replaces the mouse pointer for Blu-ray discs, which aren't mouse-compatible). The front panel has discreet connections including two USBs, one Firewire, microphone and headphone sockets, plus a card reader compatible with SD, MMC, SM, MS

and CF cards. Playing Blu-ray discs with the system connected to a 37-inch Panasonic TV, I experienced no picture problems. Discs play smoothly, with image clarity comparable to any mid-priced, standalone Blu-ray player. Sonically, the unit worked fine once we had set the appropriate output options. Operating noise is inoffensive, and can be reduced further with an optional silencing kit.

But there are reservations about the fidelity and power of the amplification. Connecting a set of M&K speakers, I found the output to be rather harsh. Separation is fine, though there was a suspicion of distortion at higher volumes. Needless to say, you won't get the kind of audio quality that you'd expect from a dedicated multi-channel amplifier.

Having a Media Centre PC integrated with amplification is always going to be a compromise, and you lose a lot of the functionality specific to AVRs (tone control, DSP presets, etc – not to mention superior components, DACs and power supply). The remote control response also seemed to be sluggish, but I'll put this down to Windows.

Media favourite

Despite some caveats, this mega Media PC solution has a certain appeal – perhaps in a secondary system or as an AV centre for card-carrying geeks. With its stunning looks and bold integration, it's one of the more impressive systems available, but it doesn't bring an end to the Media Centre debate

→ Tech Labs

Power consumption:

Playing: With our test disc playing a 5.1-channel clip, the mere 125W consumption suggests its amp module isn't working overtime

5 5

Video Jitter: Ns

Vision: Not a bad measurement for video jitter, suggesting that the analogue video output from the motherboard is surprisingly good

Multiregion Blu-ray

Martin Pipe picks up a £140 Blu-ray player along with his weekly shop

Supermarket chain Aldi, best-known for a wide range of budget buys ranging from ale to yoghurt, is selling a Blu-ray player. And not only is it the first supermarket player, it's also hackable to be multiregion! So should we be getting excited?

On paper at least, the £140 DVD1100UKT has an enticing spec. It supports hi-def audio via HDMI, is equipped with USB for multimedia playback and will deliver 1080p24 video to a compatible display.

Build quality is lightweight and the styling nondescript. Beneath the lid is a SATA-interfaced BD drive, and a main circuit board that contains both the delicate digital and AV electronics, and the power supply. This is hardly ideal; the positioning of electrolytic capacitors near heatsinks also smacks of poor design. But would this affect performance?

Performance

My test disc of choice was Transformers. After what seemed like an eternity - this is not the fastestloading player in the world - I had pictures, but no sound. An Onkyo TX-NR906 AVR, which sells for the same money as ten Tevions, yielded a 'no signal' display on its front panel. You should instead be told what audio format you're listening to. Going through the player's various output options made absolutely no difference. My Sony Bravia LCD TV vielded two-channel PCM sound when connected directly to the player, and so there presumably wasn't a fault with the hardware.

I then tried Sony's DA-5400ES AVR. Success at last! If I immediately disconnected the Sony and plugged the HDMI cable back into the Onkyo, sound was obtained; clearly, there's some kind of HDMI handshaking issue – and one that needs urgent attention via a firmware update.

In performance terms, picture and sound are difficult to fault. If you're using HDMI, that is. Component pics have minor hue/phase errors that are particularly noticeable with flesh tones. Transformers is characterised by a stupendous range of contrast, beautifully-rich colour rendition, solid blacks and impeccably-crisp detail. The only real criticism I could make was that a certain degree of judder could be seen with, for example, horizontal pans.

Audio over HDMI proved well within the DVD1100UKT's capabilities, too – no dropouts, no lip-sync errors. And BD-Live? Yes, although the manual makes no reference to the fact that a USB memory device needs to be plugged in for it to function.

However, what is most appealing about this player is that it can be hacked to switch BD and DVD regions with a few simple key presses – here's how you do it: make sure there is no disc loaded and enter 973501 on your remote. The '0' switches to DVD region '0' (all regions). The '1' tells the Tevion to switch to Region A. To go back to watching Region B Blu-rays, enter 973502. Easy huh? This unexpected bonus might make the Tevion worth £140 after all

Eco: Unusually
the on/off
button is a
proper mains
switch, as
opposed to one
that merely
switches the
player into and
out of standby

→ Tech Labs

Power consumption: Watts

25 21 100

idling: Surprisingly high for an unadorned Blu-ray player Playing: Not much of an increase in play mode, so at least it's not too power-hungry

Blu-ray on the move

Mark Craven warms to a one-of-a-kind product from Panasonic

At first glance this Blu-ray player is about as useful as a waterproof teabag - who'd want to watch HD movies on a dinky non-HD screen? but really, what Panasonic has done is create a full-spec BD deck that happens to be portable. And for that it should be applauded.

Highs

- The PHL Reference Chroma Processor Plus (P4HD) technology, Profile 2.0 specification, Viera Cast interactivity and Dolby TrueHD/ DTS-HD Master Audio bitstreaming mean this is a player on par with any standalone BD-spinner. Simply hook it up to your HDTV via HDMI and vou're away.
- It comes supplied with car headrest attachment gubbins, and a headphone socket, so it's ideal for keeping back-seat passengers amused on long journeys.
- BDs and DVDs watched on the

8.9in, 1,024 x 800 resolution screen are sharp, contrasty and smooth - only the limited viewing angle and overly vivid colours are a disappointment.

Lows

- The B15's quoted three-hour battery life seems reasonable, although in practice the device gives up after just 2.5 hours.
- The screen is designed to swivel and fold out like a picture frame, which does make this 1.7kg package bulkier than a portable DVD player. This position is practical for desktops, but it's far from ideal for watching
- The B15 is a bit tardy, taking around 20 seconds to come to life and a further 40-90 seconds to load a Blu-ray disc.
- The reedy, low-slung speaker bar is best avoided - portable users should go for headphones instead.

LINDY HDMI SCALER/SWITCH → £350 Approx → www.lindy.co.uk

Honey, I shrunk the scaler...

Do good things come in small packages? Martin Pipe thinks so

Designed to act as, or replace the front end of a display, a scaler has several functions - source-selector, analogue-to-digital converter, signal processor/deinterlacer and the actual scaling bit. They're usually big and expensive boxes, but here's an unpretentious mini-alternative.

Lindy's HDMI Scaler/Switch will convert analogue sources to HDMI 1.2. There's also a single HDMI 1080p input, plus audio support. Picture quality is surprisingly good for the price, although more expensive units are better equipped to extract the last ounce of AV source quality.

Highs

- It's easy to set up and drive from the handset or front-panel controls.
- Can be used to give an analogue PC input to a bigscreen TV that lacks one - a dedicated 3.5mm input is provided for the audio (coaxial digital can be chosen as an alternative).
- Each input benefits from its own settings memory - in addition to contrast/brightness are colour temperature noise-reduction position and basic aspect-ratio
- A wide range of output settings are provided including VGA to WUXGA, and 480i/576i to 1080p.

 The audio inputs – analogue stereo and digital - benefit from an optional delay. Audio is inserted into the HDMI output, but an adjacent coaxial output is also available

Lows

- Not as well featured as a some scalers; you don't get modes like PiP, a wide range of aspect-ratio settings, comprehensive control over deinterlacing/gamma correction or useful tweaks like chroma delay.
- The only output is HDMI/DVI, so you can't use this scaler with older displays that have VGA/RGB-HV as their highest-quality option.

Buffalo soldiers on

Martin Pipe finds good and bad points with this networkable media player

With everything from your AVR to your Xbox sporting an Ethernet port, some means of liberating media from your PC and unleashing it onto an AV system is obviously welcome. Step forward networked mediaplayers like this hi-def capable one from Buffalo. Plumb it into your network, hook up your AV equipment, configure your server and select the media you want to play with a handset-driven menu system. It's as easy as that...

Highs

- The menu system, where you choose music, photos or video from the available servers, is responsive and funkily designed.
- The Buffalo is compatible with uPnP media servers - ie the vast majority. This includes Windows Media Player 11, and the servers built into many consumer NAS boxes.
- H.264 hi-def transport streams

(like those captured from BBC HD, with a networkable PVR) are supported, but only if they're renamed with an .mpg extension.

Lows

- Video output is HDMI or composite only, and the range of output options is restricted. A lack of 50Hz hi-def (720p/1080i) or NTSC standard-def (480i) modes means some video is spoilt by unwanted motion judder.
- Despite the presence of a continuous play function, the

LinkTheater HD won't automatically play the next file in a folder. D'oh!

- Contrary to claims, there's no support for popular .mkv files. Hi-def DivX/XviD isn't catered for, either.
- No support for online media, such as internet radio.

Missing link: Use the Buffalo to play your media files on your AV system

HCC VERDICT

Buffalo LinkTheater HD £100 Approx Price check: www.techradar.com/613285

LINKSYS NMH410 → £350 Approx → www.linksysbycisco.com

Server with a smile

Steve May discovers the new poster boy for NAS devices

Servers just got sexy. No really, they have. The Linksys by Cisco NMH410 Media Hub has got to be the most presentable media savvy server yet

made. Beautifully built, it has soft lines, blue lights and is whisper-quiet. While you can squirrel it away in a boot room. I suspect you'll be tempted to put it somewhere prominent, just to show it off.

Priced around £350, it's in many ways the poster boy of the new NAS generation, and typifies the shift from utilitarian tool to consumer desirable.

 One obvious bind in running a media server is syncing it up with a PC that takes in the media in the first place. At its worst, this can involve tedious drag and dropping. The Linksys NMH solves this conundrum through a smart Media Importer app, which monitors designated folders and automatically

The Linksys is a server with a style

updates the contents on the Hub when it detects changes.

 A backup program is bundled. NTI Shadow will backup all files in the Documents folder, once an hour on default. A great safety net.

Lows

- One glaring omission from the product is integrated BitTorrent support. This is a key attraction and not having it is a missed opportunity.
- Remote access is free for the first year, ten dollars thereafter, yet it won't stream DRM-lashed content, and it's size and codec limited. In fact, it didn't work at all with a PSP.

32in LCD Supertest

With 32in TV sales undergoing something of a renaissance right now, **John Archer** and the **HCC Tech Labs** dig deep to discover the state of the art

ith so many huge screens rolling off the world's many and various flatpanel production lines, it may seem surprising that the 32in market is still going strong. But the demand remains buoyant, thanks to ongoing belt-tightening, and a desire to put screens in most every room in the house - it's just as likely these models will be hooked up to a games console or used for IPEG picture viewing than watching Freeview. So who makes the best sets? We've grouped six of the biggest brands for the ultimate shoot out, and none of our contenders today cost more than £800.

Light entertainment

If you're a bigscreen snob who looks down their nose at smaller screens. prepare to be surprised. The general standard of picture quality found throughout this group test is really very good. While some of the six screens here are undoubtedly better than others, none can be considered

to be disappointing. Indeed, it's hard to imagine owning any one and not being perfectly satisfied.

However, Team HCC doesn't just want you to be satisfied. We want you to be cock-a-bloody-hoop.

One key issue with relatively small flatscreens is picture brightness, or the lack of it.

All of the other screens look emphatically bright and colourful even when carted out of a dimmed test room environment and dumped unceremoniously into a bright room. But according to our independent Tech Labs tests, the brightest screens are the Panasonic (at 125fL), followed by the LG (at 72fL). The two dullest screens in the group are the Philips (at 51fL) and the JVC (a surprisingly lowly 38fL). But, of course, brightness is only a small part of the image story as a whole, and can in fact be detrimental if it comes at the expense of other image factors.

With this in mind, I'd argue that the most all-round dynamic picture

of our group, rather than just the brightest, actually comes from the Samsung LE32B650 (63fL).

When I talk about an image being dynamic, I'm talking about its visual range. In other words, the perceived distance between a screen's darkest black levels and brightest whites, and the vibrancy of its colours. So it's great to find the 32B650 producing some of the most natural black levels I've experienced from an LCD TV right there alongside the pristine whites.

A perfect example of this can be viewed in Tim Burton's Sweeney Todd, and the gruesome scenes in the Demon Barber's body-filled basement as Todd dances Mrs Lovett to a fiery death, against a nearly pitch black backdrop.

Philips' 32PFL9613 struggles with this scene, as its black levels aren't quite as profound as those of the Samsung. With the LG 32LH4000, the grisly scene's bright elements look almost frighteningly full-on, but the impact of the image is dented by

JVC LT-32DR1BJ → £620 Approx → www.jvc.co.uk

notable greyness over the darkest parts. The same argument applies, to a less extreme degree, to Panasonic's L32G10 (which seemed to struggle with shadow detail) and JVC's 32DR1, while the Toshiba leaves this dramatic Sweeney Todd sequence feeling flat and artificial. When it comes to colour saturation, the talents of these six TVs are particularly apparent during Todd's deliberately over-saturated 'Lovett fantasy' sequences. The Samsung and LG models give this material a rich, almost cartoon-like sensibility entirely in keeping with its tone.

The JVC is only marginally behind when it comes to delivering the full dynamism, but the Toshiba's lack of brightness means it struggles to reproduce the dream sequences with the requisite intensity. The Philips 32PFL9613 model lacks the depth and dynamics to do the sequence justice. The Panasonic's performance rather divided the team; I'd argue that while the L32G10's colours certainly look bright, they lack the tonal

naturalism - especially when it comes to reds - to deliver the same impact as its finest rivals. The Tech Labs team rated its performance rather higher, thanks to its sterling performance on our Test card JPEG challenge.

Regardless of this, the Samsung leads the way. The unusually extreme palette of Sweeney Todd presents quite a challenge to LCD TVs, yet this

PERFORMANCE

Round-up: All of our TVs prove capable of likeable pictures under certain conditions. But picture flaws such as low brightness, motion blur and black level depth among the Panasonic, LG, Toshiba, Philips and JVC models leave the excellent Samsung pictures standing out. To its credit though, the Philips does add excellent audio to the equation

JVC LT-32DR1BJ: 102300 LG 32LH4000: 12345 Panasonic TX-L32G10: 12345 Philips 32PFL9613D: 12345 Samsung LE32B650: (1) (2) (3) (3) Toshiba 32AV635D: 12845

set was able to handle the tonal shifts with ease. The JVC is no slouch here either, thanks to the processing power of its DynaPix HD engine. Its ability to deliver a super-sharp image is undeniable.

LG's L32LH4000, however, sometimes overcooks hues. I noticed this particularly during the more colour-intensive Children of Men Blu-ray - though I did acclimatise to its occasionally ripe skin tones over time.

Toshiba's 32RV635 gets things more or less right during bright scenes, but its issues during dark scenes can also lead to a few iffy tones.

Pixel pushers

Interestingly, when it comes to standard definition viewing, the rankings shuffle around somewhat. Both broadcast and DVD standarddefinition sources look remarkably well-detailed and sharp on the JVC 32DR1, for instance, again thanks to DynaPix HD, and specifically its

TV contrast: ratio

Claimed 50.000: Actual

Colour temp: Kelvin 6,536

Picture: While contrast ratio in Dynamic mode measures an impressive 30,458:1, in Standard mode it drops to 354:1. Luminance is a decent 72.80fL

Presets: The Warm setting is acceptably accurate; An ISF Expert mode features outstandingly flexible adjustment features. Cool: 10,424K Medium: 9 252K Warm: 6,536K

Budget beauty:

Nothing about the 32LH4000's glossy, subtly colourful appearance hints at its lowly price

accomplished Digital Image Scaling Technology element.

As you'd expect, Toshiba's 32AV635 excels with standard-definition. The innovative Resolution+ processing means SD images look more crisp, detailed and noiseless than they've any right to at this price.

The Perfect Pixel HD engine on Philips' 32PFL9613 is also talented at upscaling. In fact, in terms of raw sharpness, I'd go so far as to say that it made my *Pirates of the Caribbean* DVD look almost hi-def. But there's also a gritty look to the Philips' upscaled images when showing low-quality source material.

Conversely, the other standout performer so far – the Samsung LE32B650 – does a fair-to-middling standard-definition job. The black level, brightness and colour strengths noted with its HD playback are still there, but SD images aren't particularly sharp and show some signs of noise.

Panasonic's 32in screen is

outstanding with standard definition TV and DVD. I wouldn't claim that it makes SD look like HD, but it does present them with an effortless — and deeply likeable — naturalism. It's a trait that extends to its presentation of high definition.

There is, of course, a caveat here, in that a screen size of 32 inches is arguably too small to really make all that it can of the extra resolution and picture detail inherent in a high definition source. But they still have a wow factor.

The JVC model, for example, is quite capable of making high definition images looking crystal clear and exceptionally detailed – so long as they don't contain much motion. Without a 100Hz mode to activate, this screen has issues with fast-moving material, and detail drop away.

The Toshiba and LG models struggle a little with this, too, though seldom enough to stop their HD pictures from looking sharper than those of most sub-£500 TVs.

Both the Samsung LE32B650 and Philips 32PFL9613 screens can be considered sharp performers are – provided you've got their 100Hz and HD Natural Motion modes respectively turned on.

The Philips model is particularly remarkable in the way that it makes motion look totally fluid and sharp. However, the heavy-duty HD Natural Motion circuitry that makes such fluidity possible can also generate side effects like shimmering halos and occasional flickers over fastmoving objects, meaning that I eventually preferred to leave the feature off.

The 32PFL9613 is still a good enough handler of motion even without HD Natural Motion beavering away, but ultimately I felt that the Samsung's more relaxed and flexible approach to its motion processing gave it a slight edge – provided, at least, that you set the 100Hz engine to its Clear (low) mode. If you venture any higher than that it can start to look artificial.

Freesat TVs

In addition to feeding the screens both SD and HD source material, we also subjected them to the HCC Test Card, a still image torture test designed to separate the men from the boys.

The image contains difficult hues to resolve, such as red, orange and gold, a greyscale ending in 100 per cent black, scores of fine detail, from the thread in white linen, to the leaves of an old book. Not only does this test stretch the panel, but it reveals which screen is the best for those who now use their TV to view their digital camera images.

Here, the standout performer was definitely the Panasonic TX-L32G10. It delivered reds, a convincing gold, and a stunning level of fine detail, both in terms of texture and shadows. Running close with it was the JVC, which while a tad less dynamic, managed to offer similar levels of ultra-fine detail. The Samsung ranked third, closely followed by the Toshiba and LG models. However, the Philips was

rated last by our Tech Labs, due to its limited dynamics.

One final key picture performance factor to consider with small LCD TVs is the viewing angle. And in this department the Panasonic model also comes out comfortably top of the heap, thanks to its use of an IPS Alpha screen.

All of the other TVs lose contrast and colour to some extent if you're forced to watch them from the side. though the problem is at its worst with the two budget entrants - especially the Toshiba.

Sound matters

Taking the sometimes mixed picture evidence into consideration, can I pick out any clear picture starlets? Actually, yes. In fact, I can sav confidently that the two strongest picture performers of the six are the Panasonic TX-L32G10 and Samsung LE32B650.

One area where flatscreens usually trip up is in sound production. I rated the Philip sonically superior to

the rest. The use of two separate subwoofers and dome tweeters means it produces easily one of the best soundstages you're likely to hear on a small flatscreen TV, with plenty of power, loads of treble clarity, good dynamics, and even a healthy dollop of mid-bass.

The Samsung, by comparison, is feeble. It can't go loud without sounding thick and soupy, its soundstage doesn't expand convincingly - especially in the bass department - during Children of Men's full-on action scenes or the most heavy-duty orchestral mixes of Sweeney Todd.

The Toshiba and LG models struggle to open up and sound convincing with anything remotely resembling an action sequence.

Panasonic's screen sounds slightly better, delivering loud scenes with reasonable punch, but really the only contender in this group test that gets close to matching the Philips' for audio power is JVC's 32DR1BJ. It's a damn shame, then, that this raw

Colour temp: Kelvin

Picture: Unremarkable contrast ratio is boosted slightly to 2,707:1 in Vivid mode. still nowhere near the claimed figure. Luminance is a reasonable 51.07fl

Presets: The Warm preset delivers a very acceptable 6,517K, but individual RGB levels are also present Normal: 8.827K Warm: 6,517K Cool: 10,288K power is joined by precisely zero common sense, as a lack of understanding of the speakers' limitations leads to them frequently becoming overloaded to the point of obvious distortion.

Design

Considering the disparity in prices between our six TVs today, it's surprising how many of them look seriously delectable.

The only model that doesn't elicit any emotional response is the Panasonic L32G10. Compared with the others, it just looks like a plasticky black rectangle. But then that's been the case with Panasonic TVs for some time now - hopefully the design flair of its Z1 flagship plasma (reviewed on p48) will filter down to the brand's LCD range soon.

The JVC model lacks charm, a little because of its excessive chunkiness, despite the retro styling of the fascia.

The biggest design surprise is the LG 32LH4000. For this completely

belies its strikingly cheap price by looking the proverbial million dollars won in its glossy, robust frame and intriguing blue underside.

Toshiba's screen can't quite match the LG looks wise, but again it is to be congratulated for looking much more expensive than it actually is especially thanks to the slenderness of its bezel and its Sony-aping illuminated logo.

My two design stars, though, are

DESIGN

Round-up: As usual, with beautiful aesthetics, the Korean brands of LG and Samsung lord it over their Japanese and European rivals. There's just something more appealing about their fascias. The Philips screen does suffer from a larger footprint than most, but that's to house the included Ambilight panels.

JVC LT-32DR1BJ:	02208
LG 32LH4000:	
Panasonic TX-L32G10:	08808
Philips 32PFL9613D:	02808
Samsung LE32B650:	00000
Toshiba 32AV635D:	08888

the Philips 32PFL9613 and Samsung LE32B650. Both combine individuality and flair with impressive build quality to deliver looks that will have your jealous friends and neighbours drooling.

Features

When it comes to features, all six TVs have plenty to say for themselves in this department even the affordably cheap LG and Toshiba models. For instance, with the LG, I wouldn't have thought it possible to get a Full HD resolution, three HDMIs, XD Engine processing and USB support for significantly under £500, but that's one of the joys of a competitive market.

As for the Toshiha while its resolution is a more limited HD Ready 1366 x 768, it does still deliver the brand's terrific Resolution+ processing for boosting standarddefinition. And it's got a USB port and four HDMI inputs.

Given how much these budget models have to offer, it's

B Clear vision

The TV uses Samsung's Ultra Clear Panel II technology, where a polarising filter reduces screen reflections by 30 per cent

Easy access up Of the four HDMIs, three are on the rear, and one is on its side

Natural beauty:

Samsung has introduced a new 'Natural' picture mode for the 32B650 that uses an adaptive contrast enhancement circuit

disappointing that the more expensive JVC 32DR1BJ doesn't offer anything extra. Sure, its three HDMIs and USB port will satisfy many users, and its DynaPix HD processing has some excellent elements, but adding 100Hz and a fourth HDMI would definitely have helped it to justify its cost.

That's especially true when you consider that this is exactly what Samsung's only marginally more expensive 32B650 does. In fact, as well as the fourth HDMI and 100Hz frame rate, the 32B650 also offers an impressive set of online features, PC file streaming, a built-in library of multimedia content, and some really thoughtful picture fine-tuning. All of which makes the LE32B650's price look amazing value.

The only TV that gets close to the Samsung on a feature count is Philips' 32PFL9613. You only have to scan through this TV's seemingly endless onscreen menus to appreciate just how much is going on there 'under the bonnet'. And

impressively, pretty much every element of the TV's video processing and picture elements can be manually fine-tuned.

Of course, the downside to the Philips' huge flexibility is that it makes the TV unusually complicated to use. Especially as I'd recommend that you regularly revisit some picture features depending on the type of source you're watching.

Compared with the Philips and Samsung TVs, Panasonic's L32G10 initially looks a little feature-light, lacking the fine-tuning options and general internet/multimedia features that are provided by the Samsung and Philips models.

However, it does have 100 Hz, Panasonic's IFC motion-smoothing processing, and future access to BBC iPlayer functionality – plus, of course, its unique selling point, the Freesat tuner. This is a potentially big deal for HD fans who can't afford a Sky HD system. if Freesat's your bag, then I guess that automatically raises it to the top of the pile.

FEATURES

Round-up: The Toshiba, LG and JVC models are the least well-specified TVs in the group test. Though in the LG and Toshiba's case, they still offer more than we'd expect for their money. The Panasonic has its unique Freesat tuner, but for sheer flexibility and showmanship, it's the Philips and Samsung models that rule the roost, with the Sammy just shading it with its 'net widgets

TOSHIBA 32AV635→£480 Approx→www.toshiba.co.uk

The final standings

hen looked at individually, each of these 32inchers has a lot to offer and, in many cases, a unique feature that could determine a buying decision on its own. However, when examined side-by-side it is easier to separate them in picture and design terms.

Sadly, therefore, sixth place goes to the JVC 32DR1BJ. This seems harsh to some extent, since it's a capable SD performer, and can occasionally deliver very good HD images, too. But they lose resolution with motion, it doesn't have enough features to justify its price, and its audio performance is, well, bonkers.

Two TVs tie for fourth place, the

Toshiba 32AV635 and the Philips 32PFL9613. The Tosh suffers chiefly because its pictures aren't very bright. It also can't be watched from much of an angle. However, the superb impact of the 32AV635's Resolution+ system on standard definition could make it an attractive proposition to some.

At only 51fL (tested), the Philips also suffers from a brightness issue. In addition, its black levels are less profound than on, say, the Samsung set, resulting in a lack of true dynamism, Its Perfect Pixel HD engine also splits the team - it's like Marmite, you either love it or loath it. It does have Ambilight, but that's not quite enough in this instance.

The runners-up are LG's 32LH4000 and the Panasonic TX-L32G10. Both offer an abundance of features and great connectivity. And while the Panny has a Freesat TV tuner, the LG holds its own with excellent design and a hugely impressive price point. They both, though, fall flat on black levels.

Which is why the gold medal goes to Samsung, and its LE32B650. Its black levels are great for a non-LED backlit panel. They give pictures punch and an almost threedimensional feel. Plus, it's got internet functionality and, at £650, is a bit of a bargain .

→ Software highlights GRAN TORINO Clint has issues with the youth of today THE INTERNATIONAL Clive Owen reacts badly to excessive bank charges PUSH Superhero tale comes to shove THE ITALIAN JOB Still looking good at 40 BRONSON Britain's self-styled hardest man gets the celluloid treatment AND MUCH MORE!

Grumpy old man

When youth go bad, Clint gets busy. And not by running a YTS scheme

Gran Torino provides the same kind of swansong for Clint Eastwood's ultra-macho '70's-era Republican icons (such as 'Dirty' Harry Callahan) that *Unforgiven* did for his Man with No Name. Here he plays Korean War veteran Walt Kowalski, a bitter, recently-widowed bigot who despairs at the moral and societal changes

around him, especially the influx of 'Gooks' and 'Slants' into his Detroit neighbourhood. An unlikely friendship with the children of his neighbours, the Hmongs, softens him, before a chilling act of violence puts him on a course for vengeance and redemption. It may sound trite, but in fact *Gran Torino* is a wonderfully affecting characterstudy that deserves its plaudits.

Rik Henderson: Eastwood the director

always seems to favour a subdued, naturalistic filming style that suits the themes of his films perfectly, even if it doesn't always pack much of a wow factor. This Blu-ray release sports a VC-12.40:1 encode that captures this perfectly. Colours are spot-on,

blacks are deep, detailing is excellent, and there's an impressive depth to the image. Not necessarily breathtaking, but as good as this film could ever hope for.

Steve May on audio: Understated yet sophisticated, Gran Torino won't be the first disc you spring for to demo your AV system, but its 5.1 Dolby TrueHD mix is technically peerless. Brilliantly effective Foley is used to immerse you in Walt Kowalski's antagonistic world, while the full fidelity of the codec is lavished on Clint's trademark growl. The overall balance is very much weighted to the L/C/R, and unlike most other box office hits of the season, the score eschews bombast for simple themes. But it's all the more memorable for it.

Anton van Beek on extras: Brought over from the DVD are two short featurettes devoted to cars – Manning the Wheel (9mins/1080i) and Gran Torino: More than a Car (4mins/1080i), neither of which help explain the film or its production. Much better is the Blu-ray exclusive The Eastwood Way (19mins/1080i), a more substantial piece looking at the making of the film and what drew Eastwood to it. The Blu-ray also offers a downloadable Digital Copy and a BD-Live link

Shallow Grave: Special Edition

Walt Disney → Region B Blu-ray £23 Approx

Considering its status as the directorial debut of Danny Boyle, this tale of three bourgeois

flatmates who get involved with a corpse and a suitcase full of money, leading to madness, paranoia and murder, has always been poorly served on DVD. But this Blu-ray gets it right with a detailed and natural looking AVC 1.78:1 encode that is miles ahead of any previous release, and a perfectly suitable LPCM stereo mix. Topping it off are a director's commentary, interviews with Boyle and McGregor and a 30min Making of ... documentary. AVB

Bronson

E1 Entertainment → Region B Blu-ray → £25 Approx

Nicolas Winding Refen's biopic of real-life bare-knuckle boxer and criminal Michael Gordon

Peterson (aka Charles Bronson) is an arresting piece of micro budget cinema. It doesn't quite get beneath his skin, but its energy is infective and lead Tom Hardy commands the screen. Costing less than £260,000 to make and shot on Super 16, Bronson may not be able to compete with Blu-ray blockbusters, but the AVC 1.78:1 image is still alive with grain and vibrant colours. Extras include a chat-track, a Making of ... and the audio intro by the real Bronson that stirred up controversy at the premiere. AVB

Trainspotting:

Ultimate Collectors Edition 4DVD → Region B Blu-ray £22 Approx

Danny Boyle's playful mid-'90s tale of Edinburgh junkies hasn't dimmed with age. It remains an

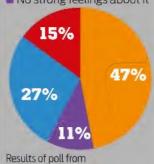

immensely entertaining piece of pop culture that tackles major issues in a serious way that still connects with mainstream audiences. Sadly, the film's Blu-ray debut isn't as auspicious as we'd hoped. 4DVD has got a lot right, such as including all the extras from the old two-disc DVD (plus a new do). But the big issue is the level of edge enhancement used to counter the film's low budget origins, which hurts the otherwise fine AVC 1.78:1 encode AVB

We asked you...

Are you happy with the new Skv+HD EPG?

- No, I wish I had the old basic EPG back
- Yes, I'm loving all the hi-def mini TV goodness
- I like elements of it, but it could be improved
- No strong feelings about it

The complete bankers

Topical knee in the groin for the people we love to hate

The International definitely isn't the kind of gun-toting action-flick that its trailer and sleeve seem to indicate it to be. Sure, there's a big old shoot-out at the Guggenheim Museum in the second half of the film, but this slow-boiling thriller about international arms deals brokered by international banks is much more of a throwback to '70's filmmaking with its focus on twisting narratives and oblique storytelling to challenge its audience

So if you're looking for bullets and battles you may do better to revisit Clive Owen's earlier Shoot 'Em Up. But if you're in the mood for something more complex and provocative, then you should find plenty to savour here...

Rik Henderson: The International ranks alongside the very best hi-def encodes I've seen for a live-action film. The VC-1 2.40:1 presentation features incredible levels of detail throughout as well as a consistent sharpness, and deep stable blacks, all of which works together to give the imagery a tangible sense of depth.

There's also a delightful, yet subtle layer of

grain in the image that gives it a naturally filmic feel. This is quite simply reference quality material.

Adam Rayner: It starts black, sound only, with thundery rain and fades in. The sound is a big part of this film's style. It uses throbby bass brilliantly to create tension and the voices are very

Although some of the dialogue is quietly spoken at times, the voices become vast against any background music. This is used to create palpable tension creation. The music is intended to stir the emotions but it only once lets loose with a full orchestral blast. I hated the use of 'tinnitus' tones, which must have been horrid in theatres. and forced me to take the unusual step of turning it down! Ultimately, this Dolby TrueHD 5.1 mix is well made and sonically gripping stuff.

Anton van Beek: The International comes to Blu-ray with a solid, if not quite spectacular set of extra features. These include an interesting chat track by the director and writer, a solitary 12min extended scene, a 30min Making of ... and three additional featurettes looking at the role of architecture in the film, the building of the Guggenheim Museum set (the only extra not in HD), and the shooting at the Autostadt.

Exclusive to the Blu-ray is a BonusView mode that suffers from a slightly small window and occasional repetition of material that is found in the other features, along with some BD-Live content that includes Sony's new CineChat

function. >

Doom

Universal Pictures → All-Region Blu-rav → £20 Approx

Dwayne 'The Rock'
Johnson headlines in
this adequate 2005
big-screen adaptation
of the popular

videogame franchise. The plot is forgettable, the performances are average at best and only the action scenes (the standout being the much-touted 'first-person shooter' sequence) deliver the goods. This BD features a VC-1 2.35:1 encode of the 113min 'uncut' version of the film, that does its best with the extremely dark cinematography, plus a booming DTS-HD MA 5.1 soundtrack. Extras, ported over from the DVD in 480p, take the form of six short featurettes. **MC**

Children of Men

Universal Pictures → Alf-Region Blu-rav → £20 Approx

I've visited Alfonso Cuaron's engrossing apocalyptic vision of the future on so many formats (cinema,

DVD, HD DVD and now Blu-ray) that it feels like I live there. The wait's been worth it. Cinematographer Emmanuel Lubezki's stylised visuals are handled with aplomb by the VC-1 1.85:1 encode, while the DTS-HD MA 5.1 audio offers exceptional tonality, if not the most persuasive surround experience ever. Extras include deleted scenes, various featurettes about shooting the film and its politics, plus BonusView content including a look at ads from the film and behind-the-scenes footage. **AVB**

Highlander

Optimum → Region B Blu-ray

Was there ever a more '80's movie than Russell Mulcahy's tale of sword-fighting immortals? Big hair,

swooping cameras, neon lighting – it's like an extended Duran Duran pop video with an equally coherent narrative. But it still entertains – how can anyone not like a film where Sean Connery tells Christopher Lambert to 'Feel the stag!'? The Blu-ray's VC-11.85:1 encode is quite sharp, but suffers from varying grain levels due to the source. DTS-HD MA audio is presented in a lively 5.1 mixes. Extras include a commentary, 3-part doc, interview, deleted scenes and trailer. **AVB**

Duplicity

Universal Pictures → R2 DVD €20 Approx

Michael Clayton's writer/director Tony Gilroy ties himself in knots with this comedic thriller about

a pair of corporate spies who hook up to rip off their respective bosses. Leads Clive Owen and Julia Roberts provide the chemistry, but the plot runs round in ever decreasing circles as it strives harder to keep us guessing as to who will betray who. If the film misfires, the anamorphic 2.35:1 transfer is gorgeous, the sharp visuals making up for the tremendously front-heavy Dolby Digital 5.1 soundtrack. The sole extra is a commentary by Tony Gilroy and his younger brother/co-producer/editor John. **MC**

Long division

Superhero fun that's heavy on the twists and turns

Push is that rare thing, a superhero film that's not based on a comic book. At times, it feels like a remake of Scanners filmed by an MTV camera crew. It's about a race to find a missing girl in a world full of people with psychic powers who are controlled by a shadowy organisation called Division. It's exciting stuff, with excellent performances from leads Chris Evans and Dakota Fanning, but it suffers a bit from trying to work too many ideas into the one film. Maybe the sheer scope of the story would work better as a comic book after all.

Rik Henderson: For the most part, Push's AVC 2.35:11080p encode is a real treat for the eyes. Awash in retinascalding green, blue and yellow colours, it boasts a vibrancy few other titles can manage, and the superior detailing gives the imagery a remarkable depth of field. The only caveat to this is that, due to moments of guerrilla-style filmmaking in and around Hong Kong, some shots (such as the exteriors of the fish market starting at 15.32) were filmed using a 16mm Bolex camera, resulting in a considerably softer look that is less detailed and far grainier than the surrounding material.

Adam Rayner: For the content of the movie, Push is far more sparing with its visual effects than with its DTS-HD Master Audio 5.1 sound. The use of the full range from tiny detailed clinks to full-on fear-register deep throbbing bass and a banging music track with jangly guitar music, makes for a sonic treat. The parts with no backing music are thus more impactful. The plot's biggest psychic weapon is a sonic attack.

Vocals are close-mic'd and there is lovely use of the rear channels by the sound designers. The film has definite sonic style as sharp as its visual one.

Anton van Beek: Sadly the extras lack the kind of imagination found in the film itself. The commentary by director Paul McGuigan and actors Chris Evans and Dakota Fanning doles out the odd interesting piece of technical info, but is far too giggly to really impress. Also on offer are a 9min featurette about the history of 'genuine' psychic powers and how they compare to what is seen in the film, along with four deleted scenes, with an optional commentary.

Rather annoyingly, you can't access the video extras from the pop-up menu while you are

watching the film, as trying to do so takes you to a dedicated menu page with no way to instantly return to your place in the movie.

HCC VERDICT

HOME CINEMA CHOICE SEPTEMBER 2009

Not any old mini adventure

A timely reminder of why remakes can be such a bad idea when the original's still great

The Italian Job is such a fun, frothy piece of late '60's escapism that even a rather saggy and slow-moving second act can't spoil the entertainment as you sit waiting for that climactic car chase. Its also manages to be that rarest of things in the cinematic climate, a mainstream action film with a sense of social commentary, offering a brighter and more playful spin on the 'angry young men' movies that had crept into UK cinemas during the decade.

But beyond that you will be kept splendidly entertained by the excellent performances, reams of quotable lines, and the longest and most impressive car advert for the iconic Mini that its manufacturer could ever hope to devise.

Rik Henderson: For the most part this restored hi-def release certainly manages to do the film proud. It's framed at 2.35:1, and the AVC encode is

completely free from dirt and scratches, while colour

reproduction is particularly strong.

If there's one caveat, it is that while fine film grain can still be discerned there are telltale signs of some over-eager digital noise reduction (DNR) being applied to the image, robbing it of some fine detailing.

Minor edge enhancement has also been applied in an effort to sharpen the image. It's far from being a disaster though and it's is a big improvement on past DVD releases.

Mark Craven: This 40th Anniversary Blu-ray sports two audio mixes. For the die-hard purists there's a restored Dolby Digital dual-mono track, while those looking for a little more 'oomph' can opt for the Dolby TrueHD 5.1 remix. The latter, naturally, has improved dynamics, but the former still sounds remarkably clean, with no hiss or dropouts, with dialogue that is nicely balanced in the mix

Anton van Beek: Paramount has clearly put a fair amount of effort into gathering together a pretty comprehensive clutch of extras for this special 40th anniversary release. The best of the bunch is undoubtedly the 89min Making of...

documentary that draws on conversations with all of the major players in the film's production, although the commentary

tracks by screenwriter Troy Kennedy
Martin and producer Michael Deeley
are also well worth a listen.

Joining these you will find a featurette on car stunts, a music video, a deleted scene (the only video extra that is not in HD) and two trailers. The only real issue is that you can't access the extra features from the pop-up menu while watching the film, as it only provides Pause/Resume, Settings, Scenes and Home options.

Canine caper

Disney dog show is CG classic

Bolt began life as a story by Chris 'Lilo & Stitch' Sanders called *American Dog*, and initially looked to be every bit as offbeat and unique as his previous film. Sadly, it wasn't to be. The film was the first Walt Disney Feature Animation project overseen by Pixar's John Lasseter and, citing plot issues, the film was completely reworked resulting in Sanders quitting.

While many expected the result to be more anodyne, the good news is that *Bolt* is a fine piece of family fun. The set-up (about the titular canine star of a TV series, who doesn't know that he's fake) is fresh enough to make up for the typical Disney character arc, the gags

the typical Disney character arc, the gags are sharp and, most importantly, it's a major step up from the previous WDFA efforts like *Meet the Robinsons*.

Rik Henderson: You want reference quality 1080p imagery? Well, the Blu-ray edition of *Bolt* has it in spades. The disc may not include the

3D version that played at selected cinemas, but who cares when the 'flat' 2D AVC 1.78:1 encode looks so good. Like Wall-E and Kung Fu Panda before it, Bolt is another flawless digital-to-digital transfer for a CG animated feature,

and – thanks to excellent blacks, bright colours and remarkable detailing, it looks spectacular.

Steve May: The reference quality

presentation extends to the audio. The 5.1 DTS HD Master Audio mix is a technically stunning brew of frothy directional effects (objects are panned front to back with

exhausting regularity during the movie's 'Michael Bay' opener) and hi-fi score. It also makes surprisingly good use of LFE. The .1 channel goes deep and loud, whenever an exclamation is required for the drama, or things blow up.

The score by John (Horton Hears a Who, Hancock) Powell, however, is a bit like a theme park ride – fun while it lasts but quickly forgotten. Anton van Beek: If Bolt falls down it's with the extras, which are almost all geared towards young viewers. Best are the new animated short Super Rhino (4mins/1080p) and the Creating the World of Bolt featurette (7mins 1080i) that looks at the choice of painted backgrounds instead of CG-renders. You also get two deleted scenes, mini featurettes about the voice talent and directors, art galleries, a set-top game and a music video, all presented in HD. It also includes a DVD of the film.

Overall: 1 2 3 4 5

Forget 'New Who' – if you want to see the time traveller at his best then you can't go wrong with Patrick

Troughton's swansong from 'Classic Who'. Plenty of repetition creeps in over 10 episodes (get captured, run away, get captured again), but it's still a great story packed with marvellous ideas. It's also a landmark for being the final black and white story and the first appearance of the Time Lords. This 3-disc set boasts beautifully restored 4:3 imagery and extras including commentaries, documentaries, set visits, interviews and even a fan film with Jon Pertwee! **AVB**

Mad Men: Season Two

Lionsgate→Region B Blu-ray £45 Approx

The brainchild of Sopranos writer/ producer Matthew Weiner, this peek into the boardrooms and

bedrooms of New York advertising executives during the early 60s goes from strength-to-strength in this second season. Given that *Mad Men* remains the most stylish show on TV, it's fitting that this three-disc set delivers stunning AVC 1.78:1 encodes. Generous extras include two audio commentaries for each episode, two docs about the rise of women's lib during the era, a costume design featurette and an interactive guide to the historical events. *AVB*

In the Loop

Optimum Releasing → R2 DVD £18 Approx

Even though it never really stretches beyond what would be possible in a feature-length TV

special (despite a couple of visits to the US) this big-screen outing for Armando lanucci's BBC series *The Thick of It* is still one of the funniest films you'll see this year. The equally hilarious and profane political satire comes to DVD with a naturalistic anamorphic 1.78:1 transfer and a subdued DD5.1 soundtrack that deals particularly well with the profanity-ridden dialogue. Fascinating extras include an insightful commentary, 28 deleted scenes, four interviews, 12 webisodes and the trailer. *AVB*

Flight of the Conchords: Season Two

HBO Video→R2 DVD £25 Approx

Two years in the making, thanks to the duo using up most of their material in the original series, this

second look at 'New Zealand's fourth most popular folk parody duo' is worth the wait. Not every episode is a classic, but between the cultural stereotypes and excellent music spoofs there's still much to enjoy. The anamorphic 1.78:1 transfer looks better this time, no doubt, due to a bigger budget, and the DD5.1 audio works wonders with the music. Extras include a documentary, deleted scenes, outtakes and more. **MC**

Afro Samurai: Resurrection

Manga → Region B Blu-ray → £23

Picking up a few years after the original series, this feature-length outing finds the Samuel L

Jackson-voiced Afro giving up a life of peace and returning to his violent ways when some malcontents bring his dad back from the dead (don't ask). Pacey and fun, Afro's latest adventure will please fans of the original – as will the colour-saturated AVC 1.78:11080p encode and Dolby TrueHD 5.1 audio, which does great things with the onscreen action and RZA's music. Extras include a video commentary, featurettes, and documentaries. **MC**

Shigurui Death Frenzy

Manga→Region B Blu-ray→£30 Approx

Samurais seem to be the rage in anime and Shigurui... is one of the darker takes on it. The moody story appears

to be the usual samurai period stuff, but quickly takes unexpected turns into dark and nasty territory — this is for adults only. The stylised, stark and gritty visuals look impressive on an AVC 1.78:11080p encode for all 12 episodes in this two-disc set. Sadly, only the English dub gets the Dolby TrueHD 5.1 treatment, the original Japanese track is just a lossy Dolby 2.0 affair. Extras are limited to two commentaries, art galleries and textless opening and closing songs. **AVB**

The Burrowers

Lionsgate → R2 DVD £13 Approx

The Burrowers is proof you shouldn't dismiss a movie because it bypassed cinemas and went direct-to-

DVD. This slow-burning period horror mixes the best of the Western genre with Lovecraftian chills in an unsettling story of a posse seeking the killers of a local family. Suffice to say, what they find is far worse than the rogue 'Indian' suspects. The film's expansive 2.35:1 cinematography is well served by the sharp DVD transfer, while the DD5.1 audio is deliciously atmospheric. Having lost the commentary from the R1 release, this UK disc offers a pair of featurettes as the only extras. **AvB**

Crouching Tiger Hidden Dragon

Sony Pictures → All-Region Blu-ray → £20 Approx

The film that introduced a generation of fans to the wonders of Asian cinema finally goes

high-def. And fans are likely to be happy with the results. If there's any real flaw it's the meagre extras. Only a commentary, interview with Michelle Yeoh, photo gallery and short *Making of...* featurette are included. However, the AVC 2.35:1 encode is a real treat. Imagery is sharp and beautifully detailed with a fine layer of film grain throughout. The Dolby TrueHD 5.1 audio is equally impressive thanks to a truly immersive feel and wide dynamic range. *AVB*

Grow up Jason

Franchise is no prettier close up

Friday the 13th is the latest horror re-imagining from Michael Bay's Platinum Dunes production company, previously responsible for the remaking of *The Texas Chainsaw Massacre*, *The Hitcher* and *The Amityville Horror*. Like its predecessors, it's glossier and more expensive than the originals, and packed with a cast of sexy 20-somethings. And, as with the original franchise, sex and death is the order of the day. But for some reason it never quite gels. It's not bad, but not

quite the re-birth Jason Voorhees deserved. *Rik Henderson:* This new *Friday the 13th* slices its way onto Blu-ray with an adequate, rather than exceptional, VC-1 hi-def encode. Framed at the original 2.40:1 aspect ratio, the transfer copes extremely well with the deep blacks that typify the cinematography, but

less well with detailing. Several sequences

look surprisingly soft and blurred,
robbing the imagery of the kind of
impact we've come to expect from
top-notch 1080p encodes.

Adam Rayner: This flick's director is
known for well crafted stuff with killer
sounds, and the film's Dolby TrueHD
track was a delicious opportunity
for sound design with those
lovely nocturnal
soundscapes full of
chirping crickets. You
feel the space and

startle at scary

rustlings and

details in single

rear channels.

He even uses

dynamic rock music from a character's headphones as feature music along with the sickening crunch of a blade ripping

through bones. Hell breaks loose and you cower as SFX and screaming lifts your already raised scalp. It's brilliantly executed and makes you clutch for the loved one's hand.

Anton van Beek: Heading up the disappointing extras is a separate encode of the theatrical cut, which runs about 9mins shorter than the 'Killer Cut' and has identical picture and sound quality. The 'Killer Cut' boasts a rather lacklustre Picture-in-Picture BonusView track that mixes behind-the-scenes footage and interviews (much of the latter is culled from the disc's featurettes) with sporadic trivia boxes that cover a variety of topics. Following this are two dull EPK-style featurettes, a look at the making of seven of the film's kills, three additional scenes and a BD-Live link. A second disc includes a Digital Copy of the movie

HCC VERDICT

Friday the 13th: Killer Cut → New Line All-Region Blu-ray → £21 Approx (www.movietyme.com)

We say: Re-invented Jason struggles to impress in HD.

Got an axe to grind? Want to comment on current technology? Need to share? **HCC** is here to help

Boo to 21:9!

I think Philips Cinema 21:9 is a bad trend. Screens have reached the perfect width for human bifocal vision.

Full-frame (4:3) was naturally too narrow, and now this abomination is trying to introduce a standard too wide.

I can understand how a slowing market would push Philips to try to create new demand, but by leading the industry off a cliff? To summarise – boo!

Alex, via e-mail

An interesting viewpoint, Alex. That the IMAX format is 1.44:1 perhaps backs up your theory on the 'perfect width for human bifocal vision', but no one is advocating that you sit so near the Philips 21:9 that if fills your field of vision! And it's not

Star

really Philips
introducing a

'standard too wide', as 21:9 format (2.35:1 and 2.40:1) films have been around for ages.

Old amp obsolete?

I recently found this 'bug'. I have a Pioneer THX receiver, the AX5SI, which cost me a considerable amount of money.

It turns out that it cannot decode any AC3 films which have a bitrate of 640kps. I never experienced this with DVDs as they tended not to use such a high bitrate for space concerns. But Blu-ray films do use this bitrate – 640kps was always in the AC3 spec.

Oddly, my older Sony DB930 decodes them just fine.

This might be of interest to your other readers. Pioneer says there are no firmware updates available for this amp. As it stands, with Blu-ray, it's a bit of a brick!

Gareth, via email

Sadly, this is not an isolated story. There are many cases of 'high-end' kit no longer being cutting-edge — just look at the multitudes of standard definition (or even HD Ready) flatscreen TVs out there.

However, you do have options: As this amp has 7.1

channel inputs, you should be decoding hi-res soundtracks in the Blu-ray player and outputting them as lossless PCM over analogue. Or, of course, you could invest in a new amp, and enjoy a whole raft of new features. It'll be cutting-edge for weeks at least.

How good can Blu-ray really be?

I have been subscribing to your magazine for almost a year now and have also registered with the website.

I was hoping to pick someone's brains over a suitable 7.1 THX speaker system with at least one or possibly two subs. My query is as follows...

I have a dedicated cinema room with an overall width of 5.8m, a viewing distance of around 4.7m and a distance of 2.1m from the viewing position to the rears

My current arrangement consists of B&W HTM61 Centre, B&W 684 fronts, B&W MT1s for the sides and rears, and a PV1 sub. I would like to upgrade to either a Klipsch system, Miller and Kriesel 150s or a German brand you've featured recently but whose name escapes me at the moment. I am running a Yamaha RX-V3800 AV receiver.

Any tips you can give that would avoid me spending £8-10k on a full THX package would be appreciated – £5k would be a more realistic budget. I am

neither an audiophile or a cinephile but I would like to have an awesome sounding set-up with real impact.

I would also be interested in your thoughts on the cross matching of the 600 series B&Ws with the MTIs and whether you think a second sub would be justified in this size of room.

Paul, via email

German speaker-maker Teufel has the widest range of THX-certified speakers in Europe. We would recommend the brand's System 9 THX Ultra 2 package (although make sure you can accommodate the subwoofer – it's big!). It's currently priced at under £3,500. However, the Klipsch THX Ultra 2 package is also well worth auditioning. Arguably, it has superior build quality, but comes in at just over £6k. We fear the

Ohmless

I've noticed a recent trend to omit the 4Ω power measurements from your results table. Is this to continue in the future? I hope not! Mike Grady, via email

Unfortunately, Mike, this will continue. We've changed the way we present our Tech Labs' findings, based on feedback from readers. We still record 4Ω power measurements, along with other tests, but simply don't have the space to show them. It boils down to 8Ω speakers being much more prevalent than 4Ω ones.

Plasma problem

I wonder if you could help with a plasma screen query. I have recently acquired an old copy of *Home Cinema Choice* (Dec

MK 150 system is beyond your price range.

As for the Bowers & Wilkins system you have created, we could only guess what it sounds like in your environment – you are better placed to make that specific judgement. However, we'd recommend you consider replacing the sides and rears with 685s or 686s. And it is always a good idea to have two (or more) subwoofers... your room seems large enough.

Winner: Star Letter writer Paul wins a copy of *Knowing* on Blu-ray courtesy of El Entertainment. It's available to buy from August 3, priced £29.99.

2003) and was reading an article pertaining to the Panasonic TH-42PW6. You mention that this model has 'not one, but four screenburn counter-measures'. I have recently purchased a Panasonic TH-46PZ81B plasma screen and having read the instruction manual, cannot find any mention of screenburn countermeasures. Could you please tell me what these countermeasures on the PW6 unit consisted of? The old article does not disclose them. Also, does my screen contain any such technology? Any help is much appreciated. Lee Massey, Northwich

Modern plasma TVs are less prone to screen burn, and the Panasonic panels have numerous safe guards already built into them that perform their duties without you noticing. One tip though, for the first couple of months, be careful with the contrast controls. Don't leave bright. static pictures on the screen for prolonged periods of time. And if you have any screen retention issues (which are not permanent) it is best to play a white screen for a few minutes - but not too long as it will reduce the life of your set.

Worst, BD deck, Ever

I was intrigued to read in HCC that the wait is over for a UK BD deck from Philips, with the BDP7300 appearing soon.
As it happens, I managed to buy a Philips BDP7100 in Belfast in March 2008.

Being an avid home cinema enthusiast and an early adopter of new technology, I bought this player on the recommendation of the store owner, and because of its onboard Dolby TrueHD and DTS-HD decoding. I didn't mind that it was Profile 1.0, as I am not interested in accessing on-line content — I simply want to watch movies in top-quality vision and sound, and enjoy whatever extras the distributors see fit to provide us with.

The first Blu-ray discs I played on the machine were Batman Begins, Master & Commander and Spider-Man 3. However, I was somewhat surprised at the inordinate amount of time it took the discs to load up — five minutes or more while the machine would noisily grind and moan! I was also surprised to find that I couldn't access the extras. As I said, I didn't expect a lot from this player, but at £400, this was a bit much.

I contacted Philips online and in fairness received a very speedy response. They provided a link to a firmware upgrade, which I burned onto a CD and inserted into the machine. Fine. I can now view the extras. However, as my Blu-ray collection expanded I noticed that, on playback, the discs would occasionally skip a few frames and jump forward.

For me, this ruined the experience of watching the movies. This problem was so bad on *Hancock* that I was convinced it had to be a problem with the disc, but the same problem persisted with another copy. And so it went on with every disc I bought (*American Gangster*, *The Condemned*, *The Island*, etc). It seemed incapable of playing a full movie without skipping.

Finally, I just gave up and last Christmas bought a Panasonic DMP-BD35 for £200. This player has been a joy to behold and is everything the Philips was not, for half the price. I decided that henceforth I would play my Blu-rays on the Panny and DVDs/CDs on the Philips.

The other evening my wife and I were reading with a classical CD playing in the background. She asked what the strange noise was so I turned down the volume and sure enough the Philips was doing a fine impersonation of a tumble dryer. I put the same CD

From the website

Is Aldi's Blu-ray deck worthy of *HCC* coverage? (see p78)...

'What a waste of space. When you can buy the new Samsung BDP1600 or the Sony BDP-S350 for £130 and £140 respectively from Richer Sounds, why would you even consider this joke of a player?'

Posted by... Scott219843760

I was curious as to what this player was like, having seen it advertised. Personally, I don't think I'd buy one but it's great to know what you guys think of it. Funny thing is, this is probably the future of Blu-ray. Next stop Tesco!

Posted by... Badtzmaru

'Many thousands of people visit supermarkets like these in the UK every day. Some must feel tempted to make an impulse buy. So why shouldn't we feature such kit and forewarn them of any pitfalls (as well as pointing out any advantages)? Could save them a lot of bother, petrol and/or money.'

Posted by... Martin Pipe (HCC)

'Yes we do need reviews like these. What if this unit turned out to be a giant killer? We would all be a bit pissed off!'

Posted by... Martin Gillespie

in my 14-year-old Sony DVD player (DVP-S525D) and enjoyed the rest of the CD in silence, so to speak.

I have now given up on the Philips completely but I look forward to your review of their latest offering. I for one shall not be rushing to upgrade to Philips anytime soon!

Tony Daly, via email

I guess there's a lesson to be learned here for us all. Perhaps it shows why Philips didn't release this player *en masse*?

How we test

Home Cinema Choice's hardware reviews combine the subjective opinion of our seasoned reviewers with hard technical data.

Chris Jenkins explains how the HCC Tech Labs work

reviews tend to be a mixture of subjective opinion and objective data. While we value the subjective opinions of our highly experienced reviews team, we like to blend and balance their opinions with objective measurements. The HCC Tech Labs have been measuring AV equipment for nearly 20 years. It was originally conceived to evaluate the performance of VCRs and CRT TVs, and it is now routinely testing Blu-ray players and HD displays.

Interestingly, much of our first generation hardware is still in use (we maintain an irrational fondness for an oscilloscope used to determine the onset of clipping on amplifiers), although our more venerable hardware is now supplemented by new software and measurement methodologies. One thing remains unchanged though: our commitment to supply you with the best possible buying advice.

Virtual Tour

Our Tech Labs consist of two main facilities: a Viewing Room, and a Test Lab.

The Viewing Room is used mainly for testing TVs, projectors and speakers and has been designed to reproduce the conditions that are found in a typical mid-range home cinema setup. It was created by award-winning custom installers Pounds (www.poundstv.co.uk), and is completely light-proofed. While it is not designed to be sound-proof, it has been skinned in Acoustiblock and has been acoustically treated and tuned by the experts at RPG (www.rpg-europe.co.uk), using custom absorbers and diffusers. The room features multiple HDMI, component video and audio cable runs, as well as analogue and digital TV and satellite feeds, and has a resident 7.2

speaker system. Multiple screens can be fed the same source material simultaneously, courtesy of a Gefen 2-in-4-out HDMI switcher/splitter, for screen shootouts.

Number crunching

The Test Lab is used mainly for number-crunching DVD/ Blu-ray players and amplifiers. It's equipped with two industry-standard systems: a Tektronix VM700 video data analyser, and a Miller Audio Research audio analysis suite. Using standard test signals from discs and signal generators, these two systems are used to measure factors such as audio and video signal jitter, frequency response and output power. These give us a good general idea of the component quality, processing power and overall performance of players and amplifiers.

Professionals at large

Over the years, our testers have been trained in calibration and testing techniques by the ISF, Tektronix, the Home Acoustics Alliance and other industry bodies. In short, when you read a review in HCC, you can be sure that the reviewer's subjective opinion is backed up by objective scientific lab testing.

Understandable and useful

One of our pledges is to present information that is both understandable and useful, for example, exposing the hype perpetrated by some makers of plasmas and LCD TVs regarding contrast ratios. To determine real world contrast, as well as measuring colour temperature presets, we employ a Sencore VP401 signal generator alongside a PC running Datacolor Colorfacts software with a Spyder 2 sensor. We use the Sencore signal generator and our own discs to generate standard TV

Tech Lab tests explained

TV power consumption: Watts

White screen: This is a measurement of a display's power consumption in Watts when displaying a pure white 100IRE signal with muted audio

Test footage: Here the power consumption is measured with a looped test sequence of live footage (complete with explosions!) and the audio volume up

TV contrast: ratio

Picture: Contrast ratio claims by TV makers are often extravagant in the extreme. Our real world measurements cut through the hyperbole and allow one brand's contrast ratio to be compared with another. You'll also find a luminance measurement in foot-lamberts, here

Colour temp: Kelvin

Presets: Out of the box, most displays will offer you a choice of colour temperature settings. We measure these to see which one is closest to the ideal of 6,500K (or D65). This is the colour temperature setting you should use for movie viewing if you

don't recalibrate

Blu-ray/DVD power consumption: Watts

Idling: If you're like us, II probably leave vour Blu-ray player or DVD player on, even when you're not playing a disc (by accident or design). This reveals how much power it consumes when in repose

Playing: Spin a movie and your disc player's power consumption will increase - but by how much? This is a measurement of power consumption when the player is playing a movie

Audio Jitter: Ps

Sound: This is a measure of analogue audio litter in picoseconds from a BD or DVD player. The lower the number the better. The score is indicative of build and component quality and relates to its ability when playing CDs. Newer players use re-clocking techniques to reduce litter with the HDMI connection

Test bench:

Equipment from the likes of Snell & Wilcox, and Techtronix allows us to compare all manner of kit signals. Colorfacts analyses the colour and luminance performance of TVs and projectors, giving us information in areas such as contrast ratio, colour temperature and luminance.

Playback

Increasingly, you've been asking for more information on power consumption, and so we've now moved these

results to a headline position on our tests. We've also developed a more graphical presentation (key below) of some of the data we produce, which should make the facts more relevant and digestible. Not all the data we generate is published (frankly, you'd be bored) but all of it goes into the melting pot of opinion. While one key reviewer is bylined for our tests, as many as four team players will contribute to our findings

Video Jitter: Ns

Vision: This is a measure of video jitter in nanoseconds from a BD or DVD player. The lower the number the better. The score is indicative of build and component quality. We also present figures for Chroma Crosstalk (another quality indicator) and frequency response @5.8MHz

Loading: Boot/Java

Disc loading & Java:
Blu-ray players can be
notoriously slow to
load and play discs,
thanks to the DRM and
Java content of BD
software. These
timings are crucial to
the user experience —
naturally faster is best

45s

AVR power: Watts

Powered: When you fire up that big AV receiver to watch a new movie you may be surprised to learn just how much current it's drawing. This is one of two measurements we take for AV amp power consumption. The other is when the AVR is powered up but idle

Amp output power: Watts (8 Ω , 0.5% THD)

2-channel 8Ω: So just how heroic is that AVR you've been saving for? Putting aside paper claims, we measure its output in two-channel stereo mode, Also noted here is a figure for Total Harmonic Distortion

100 200 50 70 250 300

5-channel 8Ω: In most case, an amplifier's muscle will be diminished when it runs in multichannel mode. We push the product to extremes in a 5.1 configuration to see how much grunt is available with all channels driven

Pure power: Watts

Fidelity firewall: This is our measurement of power untainted by distortion (typically 0.052THD, 8Ω, 1kHz). It's an indicator of both power output and component quality

Signal/noise: dB

S/N tests: These amp measurements reveal the ratio of noise to signal at a specific frequency. Readings taken at low, mid and high points help determine imaging clarity and sonic character

Editor's Choice...

60in - LX6090 £4,300 Approx

12345

Quite simply, this is the best TV in the world bar none. Its black levels are so deep and foreboding

that, when the TV is on but not showing a picture, you can't see a thing in a darkened room. Nothing. It's scary! Added to that is an ability to display fine detail that many screens would struggle to compete with, and unsurpassed colour fidelity, often searing imagery on your eyeballs long after they've faded from view. Plus, the digital TV tuner provides decent SD transmissions, even when blown up to the whole

Tested: Issue 159
For price check visit: www.techradar.com/417196

home cinema, we'd have this £40k KEF system on our list. Everything from the build quality and luxurious black finish to the 7.2 performance is awe-inspiring.

The array is underpinned by twin 1,000W, 18in tout three 10in drivers – but KEF's UniQ tweeter wizardry means high-frequency detail is captured and dispersed in all its glory. The Reference system is subtle, detailed, incredibly intricate and yet able to reproduce explosions with a visceral grip that pressurises your entire world. Musicality and mayhem all at once - and worth every penny.

Specifications

Subwoofer: 2 x 1,000W (power from separate amp unit) Finish: Gloss

- Includes IR control from receiver back to transmitte
- Active circuitry maintains signal quality up to 100m
- Simple to set up
- Robust reliable design thousands in daily use. Euro models and passive models also available please see website

Code C5OCA

Fat Gecko Camera Mount

A new camera mount with dual suction pads, ideal for fastening to car bodywork, surfboards, snowboards, etc. It makes unique video and photography capture possible from almost any angle (and at almost any speed) you can fathom. Four adjustable joints and an optional extender bar make it easy to set up shots over a windshield, around instruments, on top of handlebars, or anywhere else that a standard tripod or camera mount wouldn't normally be up to the job. Features:

- Universal 1/4" Mount
- · Extendable Height
- 360° Tilt, Turn & Rotation **Dual-Locking Suction**
- Code FGCM

Panasonic ideas for life

THE UK'S FIRST BLU-RAY RECORDER INFINITE HD POSSIBILITIES

HD) EVERYTHING

The UK's first Blu-ray recorder has arrived – and it's changing the way we view High Definition content forever. Pause live TV and record two channels at once through Freesat⁺. Store and manage all your favourite HD moments – from home movies and family photos to Hollywood blockbusters. Stream video direct from the internet, share your HD memories through YouTube and Picasa and save High Definition content to Blu-ray disc.

With so many HD features in one convenient place, it's more than just a Blu-ray recorder, it's **HD Everything**.
